Hey,
Thanks for the link to Kens web site! It's a valuable resource.
And thanks for all the replies and comment on the TS-530...Still haven't fired it up. Ive been busy with work and my dad visiting from Florida. Man, i can't waite to get it going again...those Kenwood hybrids are great!

You're welcome!

Great little scope, isn't it? Have one here that I just re-capped the
supply and keep for my B.U.

I currently use the 1470 dual trace version.

Cheers,

Hi,

You might want to double check your listings.... 1/2 is to US only and 1/2
to worldwide.

Given I've bought from you before, I know you ship to Canada ;-)

Cheers,

I am in need of a rubber ducky antenna for a PCI wireless card. It's
the one with the reverse SMA connector.

If anyone on the list has an extra rubber ducky PCI wireless antenna
with a R-SMA connector, please contact me off list and we can make
arrangements for me to get it.

Thanks for the bandwidth.

Henry WA0GOZ

I already found something, thinking a bit sideways: these SS devices impressed me more on the current- than on the voltage handling side. I reckoned that scaling to higher powers was mostly done in current, so I headed for a low power video unit I had: a long deceased bible-sized 1970's TV + radio combo, with a 2" B/W screen. As suspected, I found 2-3W low capacitance bipolars that could run into VHF... so much so I had to bead them to keep them from producing spurs in my ugly prototype.

Hmmmm.... I'll look harder. The pile of monitors is still there gracing a hidden nook of my place.

W.r.t. the high definition requiring high frequency: KVM switches often quote their bandwidth, which must match what^s required from a given definition (if a KVM only quotes that, and not pixels, good luck finding the equivalents). Bandwidths now run in the 200-300MHz range, which is a good omen.

Where would such transistors be?

In the vicinity of the HV coil?

Or near the CRT cathode?

I'm not sure why it should be so difficult to get ahold of Rev. Dobbs. Visit http://www.staidan.org.uk and follow the obvious link...

Cheers,
Tom

```

I would like to make a flexible CW TX with a broad coverage of HF, something like:

```
VXO or                  BB                                BB POWER
AMP              TUNABLE BPF
VFO          ===>    DRIVER            ===>    (2-5W, derated)
===>  PLUGIN LPFs
(50-100 mW)          AMP (.5 to 1W)             RF
TRANSFORMER           R/T SWITCHING
```

I'd like the driver-PA chain to be no-tune and unflappably stable over, say, 7-15 or 3-30 MHz, with 50 ohm I/O. I guess the driver stage(s) need not be nondistorting, as a C class PA will produce much in the way of harmonics to be accurately filtered out, but it would be nice-to-have. I don't know if a more linear power amp would help, but I'm willing to use large a derated final and go balanced and/or class A, with negative feedback, if it helps stability and bandwidth. That would help spectral purity too, but I see it as a side effect not to be relied on too much.

I looked around, found plenty of professional ready made gear, but not much in the way of tips.

I'd be tempted to start as with two low-distortion audio-like stages with negative feedback and broad bandwidth-limiting, such as small caps to ground, and large coupling caps + VHF beads in the signal paths, but it would be trial and error.

Any suggestions on where I should have looked???

tx es 73 de n1jpr/i2

I sincerely think you would have a lot more fun trying to clone a HW8.

There is no need to pursue much linearity in a cw transmitter ... unless you try to build an almost unpractical one.

Take a look at the various designs offered by Communications Concepts:

http://www.communication-concepts.com/tableofcontents.htm

They have a range of amplifiers which are based on designs originally published in Motorola application notes. (All of their amps are described as starting at 2 MHz... you'll need to check to make sure they'll actually work properly at 1.8 MHz)

The winner of one local ham club's "Homebrew Night" competition last year, was a guy who built four boards of one of these designs (I think he used the EB104), and then used a set of RF splitters/combiners (similar to the PSC-4) to gang them together. If I recall correctly, the resulting amplifier was capable of running at the 1500-watt legal limit with a fair bit of capacity to spare.

A single EB104 might meet your requirements... 6 watts in, 600 watts out.

The low pass filters on the Communications Concepts site are rated for a maximum power of 300 watts. Where can I find low pass filters rated for 600 watts (or more)?

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 16th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly, will be admitted FIRST.
Separate lines will form prior to gate opening for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered

well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

I don't know of a specific commercial source for them, pre-built.

However, the design formulas for low-pass filters are well understood (IIRC they're published in one of the primary ARRL manuals). You could construct a very hefty "loafs along and doesn't even get warm" low-pass filter, with any desired number of poles, using inductors wound on suitable-size powered-iron toroidal cores (from e.g. Amidon) and silver-mica or "doorknob" RF capacitors (from e.g. RF Parts).

The best source I know of for tables which give the reactance values for such filters is Zverev's "Handbook of Filter Synthesis" - quite dear in hardcover, but it was released in a full-sized paperback edition a few years ago and is much more affordable in that form.

Granted, Philo...

Here's how the argument goes:
- goal: minimal part count + ability to put clean QRP signal anywhere
- DC drain no problem -> class C not indispensable
- linear broadband keeps part count down and adds little spurs
- do all filtering after PA, if possible with multi-tuned tanks or plug-in LPFs

However, my request is now moot.... I don know what possessed me when
I did my previous searches, but the aforesaid info CAN be found on the
web.

Here is one example:

http://www.qsl.net/ik4auy/article_4_english.htm

Plenty of usable ideas.

I am now experimenting with a simple 2-stage drive (2nd stage push-pull) with plenty of negative feedback. May be enough to go on air.

I built the EB104, used it on Field Day driving it with an FT-817 at 5 watts pep out, getting 500-600 watts out of the Amp. Powered the whole thing with a Toshiba 1000 watt generator. Worked great.

The low pass filters were right out of the ARRL Handbook. Did not check with a Spectrum analyzer, was more concerned with providing a 50 ohm in/out Z. Used 500V mica caps and either air or T50 or larger torroids for inductors. Used a ceramic rotary switch to change bands.

If you build the EB104, make sure you understand the phasing and connections of the various transformers on the board. Use copper heat spreader, heat sinks, and cooling fans. You have to have a method of T/R switching. Be sure you understand how to set the bias on each of the 4 MRF150's. You need a power supply capable of 50 volts @ 20 AMPS. The least expensive I have found is a SMPS for about $300. The RFI was not a problem from this particular unit. The commercial versions of the EB104 reduce power thru the ALC if a serious mismatch occurs. I did not bother with this, but you might consider.

The MRF150's are about $300 for a set of matched pairs. If you are not careful you will let the smoke out of the 150's. BTDT.

Good Luck,
Gary N4AST

hfprojects Yahoo Group:

Interested builders continue to sign up for the next build of the HF SuperPacker Pro 100W Amp. Get on-board and help spread the word far and wide.

We need 100 builders like you to sign up. Our target is for your cost to be at or below $350. Volume purchases dramatically reduces cost.

Talk it up at your local ham club and swap meets. We can make special dispensation for group builds within a club. Start a fun project in your club!

Go to the the hfprojects Files Section, HF SuperPacker Pro Amplifier, Next Build Sign up. Click on SIGNUP and provide your call and shipping information. Your call will appear on the list in a few days. Check back for timely status information.

This sign up does not obligate you but does indicate your interest as a prospective builder. I thank you for your interest and support!

73 K5OOR - Virgil

Anyone have a spare manual for the Crescent TS-617 C/U Q meter that they
want to sell or know where I might find one?
tnx

There are a few items in your project I have doubts about.

The linear amplifier, for instance. You could build a very linear broadband amplifier with paired CATV transistors in push-pull. Those transistors became old stuff and were trashed the moment they were replaced by IC's (TRW, Motorola, etc.). You still can find some, but a matched pair will be hard to come by. With some transistors you may even have problems to get beneath 5 MHz. And forget about a power supply of 12 volts: you will need at least 2 x 24 volts DC. Anyway, the maximum output will be around 2 volts if you require quality. So you'll need another 10 to 12 dB to get an output of one watt or so. This will be an even greater challenge if you want to keep spurious/harmonics down to -40 or -50 dB.

I also doubt filtering at the output only is practicable. Once garbage got in an amplifier chain, it is very hard to get rid of it. Since you are considering using plug-in filters, build sets of three: use the first between the oscillator and the driver stage, the second one between the driver and the final stage the third in the antenna circuit.

Have fun!

Where do you see it for that price? Array Solutions wants $4175 which is 3 dB too much for me.

A coupla bucks a watt would be reasonable these days.

It is pretty much priced along the lines of the Icom and Yaesu amps, but is
MUCH smaller, lighter and a heck of a lot more forgiving of errors. At
Dayton, they shorted the output and opened the output while the amp was
making full power. Forced it to one band while the exciter was on a
different band.

Clint, you've obviously never operated a 48-hour contest where by the end of
```

it there is a real possibility of doing something "dumb enough". Maybe you
just don't know what sleep deprivation in contest conditions can do to you.
I'll give you the benefit of the doubt.

  48 hours without sleep is considered torture by humanitarian
organisations when inflicted on 'prisoners', I didn't realise anyone
would do it for fun ;-)

  I don't think contesting would be for me, I think I'd enjoy making a
contact on a flea power radio built from snot and tissue paper rather

more but if we were all the same the world would be damn boring.

The video amplifiers are normally on the PCB that plugs directly onto the
back of the tube. The unusual thing about those transistors is that they
are moderately fast and also capable of handling quite high voltage.

But the same thing can happen.

You start work on something, and keep at it until it's really late.
Or you've built it, and it won't work, and you stay up really late
to figure out what's wrong.  Or, you know you had that really neat
reduction drive in a box somewhere, and you stay up all night trying
to find it.  You know it's there, but you still don't find it.  "One
more box, it has to be in there....".

The longer you stay up, the less effective you become.  Get some
sleep, and you'll stop making the mistakes that keep you up even
further.

You can always grid modulate a triode tube.  The results are similar to
screen modulation of a tetrode tube.

While modulation transformers are getting a bit rare and expensive these
days there are ways to get around the problem. Years ago the ARRL
handbook used a filament transformer as a modulation transformer. The
center tapped secondary was used as the primary with high power
germaninum transistors (this was a mobile rig). The 115v primary was
the modulation secondary.

One could also use two tube type output transformers back to back.

I don't recall saying I did this Clint. It was done at Dayton to show the
amp is not prone to the problems the Icom, Yaesu and most of all the Tokyo
amps are prone to.

And I didn't suggest that you did, you said you had ordered the amp IIRC
and were waiting delivery? In my oblique and cynical English way, I
wondered if you really needed the (expensive) protection circuitry as an
experienced operator. It's a nice amp but for that price you really have
to ask if you're dumb/unlucky enough to need all that protection you're
paying extra for because I'm sure there are cheaper ways to get the
power, hell, if you really wanted to, you could even *build* something
(or does that go against the grain of amateur radio these days) for
under a quarter of that price and still make it look real pretty.

You might want to check out the Mistubishi RD16HHF1 RF MOSFET. They
are available from RF Parts at $4.20 apiece, and have similar specs to
the 2SC1969, except with 4 dB more gain. The data sheet tests them at
12.5VDC @ 30 MHz. W7ZOI did a post to the EMRFD Yahoo group about
them. I bought 35 for our QRP club at $3.10 each from RF Parts.

By the way, CB shops advertise them as "drop-in replacements" for the
2SC1969.   Grain of salt there........

The point Clint, is that other amps in its price range appear to have high
failure rates, while the SPE has zero failure rates to date. This comes down
to good engineering.
As for homebrewing, in the past couple of years I've built 2 water cooled
1296 amps and now a 400W solid state 1296 amp. Here's a shot of a recent all
mode (including sync AM) HF RX with DDS VFO (this is 100% homebrew, not an
Elecraft):
http://www.elecraft.com/PictureGallery/NewPics2/w4op_rx_ec2.jpg
so please don't talk to me about homebrewing. I build what I want and buy
what I want.

Dale W4OP

Hi, one that would possibly be quite close your needs has been described in
the VHF Communications 1 / 1982. It's a linear 3 stage wide band HF driver 4W
output and 44db power gain. Supply voltages are 28V 0.25A and 15V 0.08A.
The article is on four pages.

>failure rates, while the SPE has zero failure rates to date. This comes down
>to good engineering.
100% agreement about good engineering bringing ruggedness and I know
good quality parts are rarely cheap but I still think it's a lot of
money for a bunch of features I probably never knew I needed, it seems
an awful lot of power too, I'd question if I would ever *need* that sort
of power. (No comments about making a market for filters either ;-))

Something that's always served me well is the knowledge that price does
not indicate quality and manufacturer's will price things at what they
think the market will bear rather than the item's worth. I wonder how
many of the 'competing' products are badly designed or just overpriced
because of the name on the front (I.E. of adequate design but high
priced because of the marketing)
>As for homebrewing, in the past couple of years I've built 2 water cooled

Very nice, any more details, specs, schematics available? Internal pics
would be interesting as well, looks nice and clean with a simple user
interface.
Currently assembling the parts (slowly) to build PicaStar II and
enjoying playing with DDS chips immensely for all sorts of little
projects.  Was it your design and/or could I find it on the web to learn
from?

Please don't misunderstand me, I wasn't questioning your technical
ability but was wondering why you'd need to spend $4000+ on something
that holds your hand to such a high level. I like reliable equipment as
much as the next man but that amp seems *very* expensive.
>so please don't talk to me about homebrewing.
I'd talk with you... Always willing to learn and share knowledge.
> I build what I want and buy
>what I want.
I dream of buying what I want (but whenever I have bought black boxes,
I've been left feeling 'empty' afterwards) and build what I can't afford
to buy ready made (most things, I have a young family) in what little
spare time I have.

Try RSGB HQ, they have quite a large collection of old magazines.

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

I pulled parts from 17" Viewsonic/Optiquest, and I found a treasure
trove of parts.  The horizontal deflection amp is a VPS10S 3-channel
module (each indentical)  tested at 100MHz.  The data sheet is on
www.datasheet catalog.com. Vcc is 80 or 90 Volts, but Ic is only 75
mA.  It's the only heavy-duty-looking thing on the board that mounts
on the CRT.

However, that monitor' shielding cages would be perfect for tube RF
cages, and there are a lot of large sections of it; a couple of square
feet, at least. The video amp is an LM1205N, 3 channel 28 pin device.
It apparently drives 3 2SC1921s, 200 V Vceo, 50mA, 600 mW, Ft=130
devices.  Lots of C0G and Z7R decoupling caps on all the boards.  This
is a 1997 vintage monitor, and it was a good'un.

Dale,

Very nice work!   How do you do the labels on the front panel?

Hi Hank,
Those were done with dry transfer because no graphics were involved.
Normally I use water slip decals where the artwork is done in my CAD package
and then printed onto the water slip decal paper. This is great as it allows
for complex graphics and color if required.

73,
Dale W4OP

Would you do one decal that fit the entire front panel or individual decals for each control? I've been wondering how individual decals would look. It would *seem* (no experience here) that individual decals would be prominent and therefor less attractive.

Are decals best when placed on a matt finish or a glossy finish? (I usually use black or dark gray.) Do you lay on a clear coat after applying the decal(s)?

I like the idea of using a CAD package to design decals. Most of my stuff is one-off and silk screening seems like an extravagance.

Where do you get your decal paper? Is it compatible with laser or ink jet? My laser is color, using a dye sublimation process. Essentially, it melts colored bits of wax onto the paper. I'm not sure it will work for decals as it uses both heat and pressure to fuse the wax. May have to use the XYL's inkjet..

Thanks for the info.

If I can throw in my two-penny-worth...

I have dealt with Mirrorbow Electronics, purchased their USB IO board and it does exactly as advertised. their technical support is 100%, delivery is very quick and overall service is second to none! I have no hesitation in recommending them to anyone. I only wish some other companies would take a leaf out of Mirrorbows book for customer service!

Off my soap box now...

73s, Jason G7KPM

We know, it has been ripped apart on this newsgroup a few times. It's not a good product. If fitted without using the correct alignment procedures and test equipment it will ruin performance and cause splattering over the bands and generate harmonics. Not many people who have the "really loud = really far" mentality will know how to use test equipment, they tend to be the ones with a lack of knowledge. Maybe the type who believe polishing the aerial will lower the VSWR!
The circuit has no RF filtering for a start, it is not screened in any way, it has a light that you will never see once the radio is put back together and it will have no benefit over the microphone that was designed to operate with the radio. It will cause distortion and harmonics unless the radio is realigned using test gear. If you use that on AM/SSB you will sound terrible, it is a waste of time. There is no way that the circuit differentiates between a voice and background noises, so raising the level many times and keeping it at 100% will mean that the sound will just be a "noise". Compare that to a normal mic, audio nearer to it such as the operator voice will be louder than what is in the background.
The product is out of date, has no market and probably would have been better 20+ years ago.

I certainly wouldn't recommend it, from a radio engineers point of view.

Just like so called Engineers, your a dumb ass John.
Your are an Engineer? What a Trash truck radio Engineer?

There is a noise gate built in. Read his Good web site.
Just wondered on what happened to the Power amp He had.

> Just wondered on what happened to the Power amp He had.

The SkyWave 2879ABTC was discontinued because of a poor profit margin.
We hated to do it... but with the temperature compensating biasing...
and all the premium components and chassis... it was just too costly
to manufacture. Unlike other companies, we will discontinue a product
before we will cost reduce it to a point that sacrafices quality and
reliability. Sometimes I just go back and look at the photos... just
for old times sake... http://www.telstar-electronics.com/default_files/

I was composing a point-by-point response to this when I had a power failure and lost it. I'm not about to redo it, but let me summarize.

I am no fan of Telstar and his spam marketing on these groups and many of his claims are BS.

That said, you seem to know little more about the subject than does he.

BTW, to see the performance of this thing without the hype:

I conclude that the VOICEMAX issue has died, has had the funeral and now should be buried.

Those who advocate high distortion levels and poor quality signals can spend their $$$ and buy it.

Those who prefer low distortion and clean sounding signals won't.

Let the trip to the cemetery begin.

/s/ Deek

LO and RF ports are rated from 4 to 8GHz, IF port is good from DC to 2GHz.
Noise figure is 5dB, and port to port isolation is 35dB. This dats is from
my purple WJ data book.

Pete

Hi All,

I guess a few of you have been taking a look because Geocities has temporarily closed down the webs site due to excessive bandwidth :)

If this continues, I can move the site to a new server.

Also, I have a few schematics to add in the next day or so, so please keep checking for updates.

Regards,

Mark

I'm in the process of removing parasitics in the final of a 6DQ5 75W transmitter (1963 ARRL HB, pg 176), and am in need of source for 2+ watt non-inductive reistors for parasitic traps in grid & plate circuits. Sources for higher wattage carbon composition resistors seem to have dried up. Can ceramic composition resistors, such as Ohmite's OX/OY series be used? They are touted as "non-inductive". Please advise.

73,

George, KB1HFT

How about that... I had a quick look, and cracked up over that one abut
getting 500 watts out of a 6L6. Didn't read deeply, but saw a few links
I'll have a read later.

Thanks.

> Some of the tube lovers are even mid-teenagers :-)

There ae also guys out there that, for wacko (?) reasons, like to restore
old cars (eg. Model T fords) and drive them around, too. ;-)

Hi,

Talk to Steve at http://www.apexjr.com

He has AB carbon comps.

For some things, like RF and high transient current, nothing else will do
as good, I'm afraid.

Cheers,
--
Gregg

This one keeps coming around...

"Inductive" is not a yes/no quantity. Any component has stray inductance, so you always have to ask <how much>.

Carbon composition resistors never were completely "non-inductive"... except by comparison with wirewound resistors. That claim was always a lie, and it shouldn't scare you away from more modern resistors where the manufacturers are being more honest about how much (or how little) inductance there really is.

There's a very good reason why carbon composition resistors are becoming hard to find. In professional equipment they have been replaced by metal-film resistors, which are better in almost every way. MF resistors have better stability of the resistance value, and better thermal performance in a smaller package, because the resistive element is on the outside where the heat can get away more easily. MF resistors also have vastly better tolerance of high operating temperatures - which are guaranteed to exist at the anode cap of a transmitting tube.

The bugaboo about inductance will go away if you look hard at it. Instead of running scared when you hear the word "inductive", find out how much inductance there really is, and how much it's really going to matter.

Scrape off the coating of a typical wire-ended MF resistor, and you will see that the grey metal film has a slow spiral groove cut into it - in effect, the resistive element is a few spiral turns of flat ribbon. Do the same for a range of resistance values, and you'll find that the pitch of the spiral and number of turns will vary from one resistor to the next. The more turns there are, the longer and narrower the ribbon becomes, so the higher the resistance will be.

But it is quite rare to find more than about 10 turns, because the manufacturing process becomes too difficult to control accurately. For the next higher resistance value, the manufacturer will step up to a higher-resistivity base material, and drop back to the lowest number of turns. Then the whole cycle of gradually increasing number of turns can repeat up to the next break-point. Incidentally, this also means that even some very high resistance values can also have a very low inductance.

There is no universal way to predict which resistance values will have the lowest inductance, because the break-points between about 10 turns and about 1.5 turns will be different from one manufacturer to the next. If you really want to find out, you have to scrape off the coating and look for yourself.

If you do that, then measure the dimensions of these little 'coils', count the numbers of turns, and plug the values into the standard formula for inductance. You will find that typical values of inductance for small MF resistors are only a few tens of nanohenries - in fact, not much more than the inductance of the wire leads! The values are in exactly the same ballpark as carbon composition resistors. (I have verified this by direct measurements with a network analyser; and it wasn't easy, because the parasitic inductance values genuinely are so small.)

So now you have to ask: will a few tens of nanohenries matter in my circuit? At all frequencies up to about 100MHz, the answer is almost invariably NO.

(The only exceptions are when you're trying to make a resistance standard for use in measurements at high frequencies. However, you can make an excellent low-VSWR dummy load by connecting a large number of small MF resistors in parallel, as the parallel connection reduces the effect of the stray inductance.)

For all of these reasons, most makers of big power amplifiers have moved to MF resistors for VHF parasitic suppressors - typically a bundle of 2-3 3W resistors in parallel. The critical factor for power dissipation is the RF heating from normal operation at 24-28MHz, where a small fraction of the RF power will be lost in the resistor.

With your baby 6DQ5, you can use 0.25W MF resistors whose inductance will be tiny.

When you're building retro equipment from the old handbooks, wherever you see 'carbon composition', remember that there weren't any other choices back then. If the ODGs who wrote those books were still around today, they'd all be using metal film.

What values do you need? I have a bunch from the 60's. Clean and never
used. If you need a couple and your needs match my supply, I'll just
mail them to you.

Al

In several cases (can you say "choke fire in the final cabinet that took out the parasitic suppressors too"?) I've replaced these with 2W/3W/5W metal oxide resistors with no problem. I think I was using the el-cheapo Xicons from Mouser.

When I've purposefully burnt low-ohm metal oxides (it's surprisingly hard - the resistor literally has to glow red hot for it to happen!) it is clear that while there is a spiral winding, that it's quite wide and only a turn or two for the resistors in the low ohm range and that the turns are extremely wide and fat. They could very well be lower inductance than the original carbon comps.

In fact the original choke fire that took out the original parasitic suppressors probably resulted from parasitic oscillation in the finals (I always assumed so - drawing a couple hundred mA with no input, and a bright blue glow from the final compartment, I always thought must be some sort of parasitic!)

You can still get carbon comp resistors at DigiKey. They aren't as cheap as
metal film, but for sensible power ratings they aren't crazy expensive.

> But it is quite rare to find more than about 10 turns, because the manufacturing process becomes too difficult to control accurately. For the next higher resistance value, the manufacturer will step up to a higher-resistivity base material, and drop back to the lowest number of turns. Then the whole cycle of gradually increasing number of turns can repeat up to the next break-point. Incidentally, this also means that even some very high resistance values can also have a very low inductance.
>
> There is no universal way to predict which resistance values will have the lowest inductance, because the break-points between about 10 turns and about 1.5 turns will be different from one manufacturer to the next. If you really want to find out, you have to scrape off the coating and look for yourself.
>
> If you do that, then measure the dimensions of these little 'coils', count the numbers of turns, and plug the values into the standard formula for inductance. You will find that typical values of inductance for small MF resistors are only a few tens of nanohenries - in fact, not much more than the inductance of the wire leads! The values are in exactly the same ballpark as carbon composition resistors. (I have verified this by direct measurements with a network analyser; and it wasn't easy, because the parasitic inductance values genuinely are so small.)
>
> So now you have to ask: will a few tens of nanohenries matter in my circuit? At all frequencies up to about 100MHz, the answer is almost invariably NO.
>

Adding to Ian's good words, the larger resistors (1W, 2W and sometimes more) are commonly metal-oxide. They also work well, and have the same few-turn spiral structure that the metal film ones do. Several years ago I measured a little dummy load I made from four 200 ohm 2W metal-oxide parts in parallel. The construction was "tight" so that the leads didn't contribute more inductance than the resistors themselves. I don't have the numbers with me at the moment, but I recall a return loss measurement equivalent to about 1.1 or 1.15:1 at 150MHz, and around 1.5:1 at 450MHz.

The metal-oxide resistors have another interesting characteristic. They can dissipate enough power to glow red and do a very respectable job maintaining their resistance value--though expect some change if you let them get that hot. That's a double-edged sword. On the one hand, it's nice to know they will be pretty stable, but if you mount one on a circuit board, you need to make sure that it won't dissipate too much power, because it's quite capable of burning a hole in the board. It's very unlikely that a carbon composition resistor, or a carbon film, or even a normal metal film, will be able to hold its value as well if it gets that hot.

Cheers,
Tom

In addition, about carbon comps... I had been saving them for years, and about three years ago now I went through my whole stash, from 1/4 watt (and even a few 1/10-1/8 watt) to 5 watt monsters, measuring them all--a few thousand of them. (One might ask why I bothered, given the results...) OVER HALF were out of tolerance, many by a LOT. Almost all were high, but the occasional one was low. It wasn't uncommon to measure them at twice the marked value and more. It didn't seem to matter if it was parts salvaged from equipment or unused ones. It didn't seem to matter what brand they were; I could recognize that from the appearance (mainly IRC and Ohmite and some British ones from a manufacturer whose name I've forgotten). I've saved a few of the in-tolerance ones of particularly interesting values, but mostly they were tossed in the trash (out-of-tolerance) and given away (in-tolerance). All in all, they were pretty terrible parts by today's standards. I wouldn't even think of designing one into a production piece of equipment.

Cheers,
Tom

Danny,

C&H Surplus in Pasadena, CA, has tons of various meters available. I saw some there just the other day. http://www.candhsales.biz/CandH/ .

Regards,

Al W6LX

I'm looking at a dual diode, SBL3040. It's rated at 30A. The package is
TO-3P. The leads are no less than 1.9mm x 0.51mm. That's about the
density of smashed #20 solid wire, which makes me wonder; how can a
device with such tiny leads be rated at 30A?

(a) Heatsinking to the terminated end of the lead.
(b) I believe the 30A max average forward current is in the mode where each rectifier conducts half the time, the average being for both diodes, though note that the RMS current is commonly higher than the average current.
(c) The case would normally be connected electrically to carry the cathode current.
(d) Flat wire gets rid of heat to the air better than round wire.
(e) Fusing current for 20 AWG copper is 58 amps...expect a 20 AWG copper wire in free air to melt at about 58 amps.
(f) 1.9mm x 0.51mm = 0.969mm^2; 20AWG at 0.032 inches diameter works out to about 0.52mm^2, so your leads have almost the cross-section of 17 AWG. (though the Diodes Inc data sheet for that part says the leads could be as small as 0.3mm x 0.51mm, more like 25 AWG which has a fusing current for round copper conductors of about 24 amps).

If the 0.52mm^2 leads on your part get quite hot, they might be as much as 0.6 milliohms per inch. At 31.6 amps RMS, that would be about 0.6 watts per inch. Compare that to a half-watt resistor, and it doesn't sound so unreasonable.

Good day all!
I've been having some problems with my 820s. It was fine for several
years and then I had a flashover in the finals. This may have been due
to a faulty ground on a "UHF" coax connector.
Have replaced the finals with 12 volt 6146B's (putting the heaters in
parallel of course). However although it now works, its effeciency is
damned awful. When it is loaded up to give 60 watts RF into a dummy load
the dissappation in 6146 anodes makes then glow cherry red!!!
Now my info tells me that the 6146B is rated at 30 watts anode
dissappation per tube (total 60 watts) so based on my 50 odd years of
electronics wouldn't expect a red hot anode at anything like the
theoretical 66% efficiency.
Yes, I have replaced the anode coupling cap (with an appropriate 3Kv rf
type) checked all the tube voltages set up the neutralisation and tried
the rig on all bands to ensure that the padding caps are OK. Same result!
My thinking is that my 6146B's may be in poor condition. Unfortunately
My old Heath valve tester does not do a very good job on big power
valves so although it says they are OK I don't really trust it.
So far I can't locate any parasitics up to about 120 MHz either.
Anyone had a similar problem? I am getting so fed up with it that I'm
thinking of running with 1x6146 and building a small linear amp
~400watts to drive the antennas.
Regards Cliff Wright ZL1BDA ex G3NIA.

I should have made it clearer that metal-oxide resistors exist, and are generally similar to metal-film in their construction and low inductance.

However, we can only say "generally". If the very lowest inductance is important, you need to remove the coating and check for yourself.

Metal film resistors do seem to behave well in similar tests. Like Tom (and Tim in another message) I have deliberately overloaded samples by a factor of 10 to see what would happen. From glowing bright red, the resistance returned to a few percent of the original value.

In parallel tests, modern carbon film resistors simply burned up - which is exactly what you would expect carbon to do. I didn't waste time on carbon comp, as any OT already knows they cannot tolerate even moderate overloads without oozing organic binder materials, accompanied by smoke, an awful smell and a large, permanent increase in resistance.

The other low-inductance power resistors that haven't been mentioned are the flat-film types, designed to be bolted down to a heatsink. There's a nice constructional example of a large RF power attenuator using these devices at:
http://granta.digital-crocus.com/Attenuator.php3

What surprises me is that carbon comp resistors are still available as specialist items because of their claimed performance in pulsed applications. With so many alternatives available, that have almost equally low inductance and vastly superior power handling, it would be interesting to learn what the specific advantages of carbon comp might be?

These modern power resistors are also much smaller than traditional types... but this too can be double-edged. I sell a kit that includes a number of 1W, 2W and 3W metal film resistors, and occasionally receive e-mails saying: "There are several small resistors left over - and where are all the power resistors?"

Sorry - that should say: From glowing bright red, the resistance returned to WITHIN a few percent of the original value.

Tim Shoppa wrote:

>When I've purposefully burnt low-ohm metal oxides (it's surprisingly hard - the resistor literally has to glow red hot for it to happen!) it is clear that while there is a spiral winding, that it's quite wide and only a turn or two for the resistors in the low ohm range and that the turns are extremely wide and fat. They could very well be lower inductance than the original carbon comps.
>
>In fact the original choke fire that took out the original parasitic suppressors probably resulted from parasitic oscillation in the finals (I always assumed so - drawing a couple hundred mA with no input, and a bright blue glow from the final compartment, I always thought must be some sort of parasitic!)

Parasitic oscillations are the subject of perpetual Holy Wars among certain amplifier builders... but both sides do agree about carbon composition resistors.

The resistors used in parasitic suppressors have to operate in a very hot environment, and they are also subject to heating by the RF current passing through them (especially on the higher HF bands). With carbon composition, the resistance is virtually certain to increase over time. This makes the parasitic suppressors less effective than they were when the amplifier was new, so there is some small risk that parasitic oscillations may reappear in older amplifiers.

If this happens, both sides agree that the original carbon comp resistors should always be replaced by metal film or metal oxide resistors - or preferably by a small bundle connected in parallel to reduce the inductance. (However, if the amplifier is still stable, it's usually better to leave well-enough alone until something happens, or until the next major overhaul.)

The same applies to the much higher-value resistors that are connected in parallel with the electrolytic capacitors in the power supply. These resistors are intended to equalize the voltages across the capacitors, but many old amplifiers used under-sized carbon composition resistors. Once again, these are virtually certain to have increased in value by an unpredictable amount, and instead of equalizing the voltages, some of them may now be having the opposite effect! Replacement with 3W metal film or metal oxide resistors is strongly advised (probably of a lower value than original, for improved voltage equalization).

Once the carbon composition resistors have been replaced by metal film or metal oxide, the problems of resistance change will be gone for good.

what exactly are "12 volt 6146B's" ?
6146B have 6.3V heater. What tube are you using exactly?

There were several variants with different heater voltages. I once bought a bunch of them cheaply at a hamfest. If you were building your own rig and could set the heater voltage, they were well worth the price.

In a commerical radio, e.g. the 820, they were of absolutely no use.

Geoff.

yes, I remember, but afair they had different "names", surely not
marked as 6146B.

The tubes in Question are a pair of 6883B's. According to all my data
they are identical to the 6146B except for a nominally 12.6 volt
heater rating, and a tiny increase in interelectrode capacity (about
1%). They were often used in high power (~60 watt) HF "bush" radio
telephones in NZ until recently, both in SSB and AM modes.
So they are relatively common here.
I pulled the covers off the final to check after your posting.
Since the 820S actually runs the 6146B heaters in series from 12.6 volts
there should be absolutely NO reason why they couldn't do the job with a
simple heater rewire from series to parallel.
They are physically identical to a 6146B externally.
Hope this clarifies the situation.

Indeed the 6883B is like a 6146B with different heater voltage. Then either these tubes are bad or you have another problem on your radio. Check antenna TX/RX relay and antenna socket connector. I had an FT-102 with antenna socket with an intermittent solder joint and it caused all sort of problems. It seems that you already checked all voltages on the tubes, but it might help to know what you exactly measured on the various grids and anodes, both in RX mode and in TX (idle). Do you observe any variation on the idle current of tubes when in TX mode with no mic input? When these tubes fail usually they have an ever increasing idle current and there's little to no way to stop this current to increase.

That should work fine.

When it is loaded up to give 60 watts RF into a dummy load
> the dissappation in 6146 anodes makes then glow cherry red!!!

Does maximum power out perfectly coincide with the dip in plate
current? What is the quiescient plate idle current in SSB? What
is the grid drive current when tuning? Are you using a terminating
type dummy load wattmeter, or an inline wattmeter to an antenna?

What is the plate current when tuned for 60 watts output?

> Yes, I have replaced the anode coupling cap (with an appropriate 3Kv rf
> type)

That wouldn't be a likely cause.,,

checked all the tube voltages set up the neutralisation and tried
> the rig on all bands to ensure that the padding caps are OK.

Double check you coax jumper cables for problems, unsoldered
shields, etc. Sometimes simple solutions to difficult problems
elude us.

Peter k1zjh

I've seen sellers like that take a more perverse course; if they don't sell, he'll up the prices a bit and inevitably there will be a buyer who feels pressured and bites or in the alternative if they fail to sell, they will be unceremoniously scrapped.

Regards,

Michael

Cliff -
You mean "wired in parallel".

A flashover in the final compartment can take out other things. You may have a failed plate choke, a leaky/lossy blocking capacitor, etc. Often the damage is visible (as in "plate choke is on fire" or "coupling capacitor looks like a burnt black potato chip") but other times it is not so visible - e.g. arcover inside the plate choke that makes it look OK from the outside, may even give the same DC resistance on an ohmmeter, but completely negates its usefulness in letting the plates swing at RF.

You don't say what your 12V 6146's are (you keep on calling them 6146B's but obviously they cannot be), but some of them are not directly drop-in, they require not just tweaking the neutralization but a change in biasing. I'd expect if you're truly putting 60W out, that you can look at the power in (Volts times Amps) and figure out if the dissipation should be making them glow red or not. It's possible the metering circuitry got fried in the arcover too (some meter the cathode current, some meter the plate current, but in either case the resistors used as meter shunts can go wrong, or sometimes the chokes and bypass caps between the final compartment and the meter can go bad too.)

If the plates are going red with what you think ought to be just idle bias on the tubes, then you either have a bias problem, a metering problem, or a nasty runaway parasitic, or all three! Often these symptoms do not arrive in isolation but in threes!

Tim.

Hi Guys!
Well I got a chance to look at the TS820S today and solved at least some
of the mystery. When I had the flashover the meter went O/C so i had to
replace it with a simlar meter with the original face.
Although it worked fine as an S meter on RX and Ok for the plate voltage
and RF levels it turned out to be about 40% LESS sensitive than the
original. When I carefully checked the cathode resistors (5 Ohms)I
discovered that the meter was reading about that much too low!
Result Class A linear amplifier!!!!!
No wonder the anodes were getting hot!!!
Set things up properly by altering the multiplier resistor for the meter
from 3.3K to 2.2K and everything starts to run in AB1 as it should and I
get 80 Watts without red hot anodes!
However the overheating has definitely damaged my finals and I think
that they are a bit gassy as they Anode current on key down definitely
drifts upwards.

So next Junk sale I'll be looking for some more 6883B's as replacements,
fortunately as I explained they are quite common here in NZ.
Many thanks for all your suggestions, it just goes to show how easy it
is to miss the obvious even after more than 50 years in electronics.
Best 73's Cliff Wright ZL1BDA ex G3NIA.

No. They are ruggedized versions of 6146A's. Still have the same heater voltage (6.3) as regular ones. Note that they are NOT the same as 6146B's however in a TS-820, it may not be noticable.

Have a quantity of Test Equipment and Radio Communications Service Manuals, both Commercial & Amateur that I have rescued from the Dumpster. Most of them are in Like New Condition.

Please check my site: www.rodemi.com   for what is available. Click on the MANUALS Heading. I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

Is it convenience or the laws of physics that modulators are always two tubes in push pull?

I have an extra 811 and socket and was wondering if there is a way to use this to plate modulate my 811 cw transmitter.

Push-Pull allows you to runn in other than class A, which is about 35%
efficient. However, class A can result in very good audio.

Some high end audio amplifiers are single ended class A. High power puts
out a lot of heat.

Back in the year one, Bill Orr, W6SAI, published an article (When QST was
still a technical magazine) on a single 304TL Heising modulator. I built one
to modulate a 4-400A.

Ran class A when you were talking to it, ran class C when you weren't.
Shifted the bias at a syllabic rate by rectifying a bit of the preamp audio
and applying it as forward bias when talking. Worked very well, quite
efficient, and the origin of EBC. The Electronic Bias Control bias shift
seen in 1970 and 80 Alpha RF Amplifiers to hold down plate dissipation for
class AB and B operation.

Which Year One was that, Harold? Where I became a ham many years back, there was a creative fellow in our club who designed a compact AM transmitter using a couple 6146s, one for the RF PA and one for the audio output. They were coupled not by a choke as in Heising, but by a common audio output transformer, available back then much more readily than a modulation transformer, and having the advantage that the DC in the center-tapped winding was (nearly) balanced, avoiding saturation effects in the transformer and allowing the use of a

relatively small transformer. I think Mitch designed that thing in
the mid 50's.

Cheers,
Tom

Hi Tom. Must have been around 1954, cause I'm sure it was after I came back
from Sunny Athens Greece. (SV0WX) I have the complete QST on disk, if you'd

like to peruse the article, I can go find it for you.

(Yes, and there was another one. Mobile Tube rig, winding up in a 10 Watt
2E26 I think, with something like a 25 Watt transistor audio amplifier for a
modulator. Part of THAT was rectified and used for the B+ for the rig. I
started on building that and then found a vibrator supply.)

Regards
W4ZCB

Oh, the good old days when you could mention vibrators in polite
company and not get odd looks, and when the whir of a dynamotor likely
meant someone had keyed up to transmit.

I suppose Mitch got some of his ideas from articles in that era, but
for sure the design was his own, with quite a few innovations as far
as anyone around there knew.

No need to look any of the old QST stuff up for me.  I'm too busy
having fun with all this new-fangled stuff, trying to get IIP3s above--
well, above some pretty large numbers.

Cheers,
Tom

Nope. A 6146W is just a ruggedized version of a 6146B. Same pinout,
voltages, everything. I have two of them in my Kenwood TS820S, replacing
S2001s.

Put the extra batteries in series, so you can use some decent
amplifiers requiring 60-100 V. Since it is unlikely that you are going
to transmit all the time, the 12/60 V battery charger inverter can be
rated at a lower power level.

While it may be possible to build mobile antennas that efficiently radiates most of the transmitter power at VHF/UHF and perhaps on the upper HF bands, the efficiency of a mobile antenna on the lower HF bands is very bad, most of the power would be dissipated in the antenna structures.

On lower HF bands, the car body is not a sufficient ground plane, so there might be high RF voltages in the car body compared to ground, which could cause nasty RF-burns if operated on a parking lot and someone touches the body of the car. Also the modern electronics in most cars might not work in such environment.

Paul OH3LWR

I'd series the batteries for 24 volts at least. That makes a much more manageable system.

I'm currently running a KW PEP out with just 4 transistors.

```

Does anyone have a copy of the circuit diagram for a Howes DFD5 frequency counter module. I recently aquired one of these and I would like to get it working again. All searches on the web have drawn a blank.

Regards Bill

That's the problem with building some kits... to troubleshoot them yourself, you may need equipment that many hobbyists aren't likely to have (e.g., an RF signal generator in this case), yet a company probably really does need to charge you at least $50/hour to have a tech sit down and troubleshoot something that didn't work.

What your friend should do is sit down and spend, e.g., half an hour of his own time going through and verifying all the components were inserted correctly and all the solder joints look good. If that doesn't help, he can probably still sell the kit on eBay for, say, $10 or more -- some people enjoy the challenge of fixing dead boards.

I remember the days when those offering kits could only expect a kit builder to have a multimeter and not even an oscilloscope -- some kits included quite clever internal circuitry to help one align or fine tune their settings.

You can run anything you want as long as you have the resources. Some 50+ years ago, in an old Radio Handbook (Bill Orr?), there was (I think) a discussion and photographs of a 1kw SSB transceiver and it was using a water-cooled jacketed metal ceramic tube and for extra power, a three phase arc welder generator under the hood. The rest was a piece of cake.

P.S. the circuitry was pretty simple, but watch out for the water cooling and pump and reservoir (not for the faint of heart).

Thanks for the feedback, however I'm not so much interested in charging systems as your views on generating the RF power out of solid state devices.

Roger,

I appreciate the advantages of running higher voltage devices but going that route I'd prefer to convert from 14 up to at least 50v.

Do you have details of your amp anywhere up on a web page by chance.

I believe G3YXM runs a similar system.

Anyone of you into high power solid state RF design?

Phil G4ZOW

There were a total of 10 editions of this book.   The 3rd was published in 1977. The 4th was published in 1983. I think that there was an edition, possibly the 8th, published in 1992. The 9th edition was published in 1994. The last was published in 1996. Ken Cornell died in 1997.

It is the 4th edition (1983) version of the Low & Medium Frequency Scrapbook
that I am after.
I am reliably informed this edition has 13 pages of info on a
build-it-yourself coil winder.
However, if anyone has a copy of another edition with the same info, I would
be very interested.

I have one, didnt build it.
Never measured the specs but I know I can hear AC a hundred miles away.
There is no front end on the thing and its subject to image problems and
interference from strong FM stations. You get what you pay for.

Dear friends,

A Front-End with an IP3 over +50dBm?

Some of you may think ..."it's a joke ! Gian 's brain got heated-up by the South Italian sunshine" .... Maybe....

Our friend Martein, PA3AKE, as you know, has done quite an important work on looking and measuring performances associated to the H-Mode Mixer with different kind of switches starting from the FST3125 and ending with the FSA3157, resulting with IP3 around +50dBm. But what can we do with a mixer like that when front-end Band pass filters may have problems to reach an IP3 of +40dBm (see the CDG2000 input coils and transformers IMD limitation) without talking about the post mixer roofing filter that may not even reach an IP3 of +30dBm.

Well Martein has been continuing his silent work on input Band Pass Filters and roofing xtal filters. He has just published his findings on the input BPF, at the moment the one for 40 meters band, and more important how to bring the roofing filters IP3 over +50dBm !!!
YES... maybe my brain has been heated up but Martein is living in Holland and the sunshine heat is more mitigated there ...

He still has to do some more work, particularly on the front-end BP filters, but he has certainly done a few things very important:

1)   The result is an MDS of -133dBm in SSB bandwidth and an IIP3 of +51,2dBm resulting in an IMD3DR of 122.8dB on 40M. !!!!

2)   He has put a lot of efforts to write the associated documentation

for the benefit of all of us. You will be surprised when reading all his measurements and how he solved problems.

3)   As Colin Horrabin, G3SBI , the inventor of the H-Mode Mixer, said: Martein's effort is the first he knows to break the 120dB IMD3DR boundary!!! (real life figures not simulation)

Martein has also rearranged and updated is web page, enjoy the visit:

http://www.xs4all.nl/~martein/pa3ake/hmode/index.html

The old mixers are fighting back Hi!

FYI, FWIW...

As I recently became retired my interests have evolved towards building homebrew tube gear. Reasons: i) simplicity in circuitry, ii) comparatively large tubes & sockets make soldering easier, iii) accidental slip of the test prod might not kill a tube but might a transistor, iv) yeah, I like to see those filaments glow, too, v) can still get those tubes but some transistors you can't find anywhere, v) throw-away technology (boards) is bad ecology...give me discrete devices any day, and vi) with high power heat sinks, silicon compound for conduction of heat (if it gets on your fingers, its hard to get it off) is needed and that damned metal can getdamned hot.

I've been building a tube SSB transmitter for about 1-2 years now (parts of it can be seen at http://www.panix.com/~asd) and ends up with a pair of 813s in grounded-grid, driven by a single 811a in G-G, lots of home brew antenna tuners, and Icom 707 for the moment SSB transciever.

The homebrew SSB exciter lineup is not yet pictured, but at its current stage of construction is almost ready to go on the air. Generate DSB at 2 mHz with 6AL5 balanced modulator, upconvert by mixing with 7 mHz to 9 mHz (6BE6), use McCoy 9 mHz crystal filter (somebody gave it to me 25 years ago) to shave off the desired sideband, mix (6SA7) with 5 mHz local oscilator (by doubled 2.5 mHz from old war surplus Collins 70H3 VFO [from Fair Radio Sales when they had them, they ran out years ago]) to get 4 mHz (75 meters, my favorite ragchew band) which the scope shows to be about 5-10 mv, and goes into two 6C4s (triodes, grounded cathode) and then into a 6AG7 & 6146. I am at the point where I need to make a RF transformer to take the output of the 6146 to drive two more 6146s in parallel to get the ten watts I need to drive the G-G 811a. Yes, if I could optimize everything better, I could use less tubes. But, I preferred to make modules (lots of stages are built inside of old computer power supply cabinets (they are about 6x6x4 or so, and nice to work with, cheap at hamfests at $1 each or so). All the gear is full of those old D'arsonval "Frankenstein"-type (real) meters (not this LED crap), so I can keep monitoring practically all the voltages on anything. Its not very pretty to look at, but its a whole lot easier to work on than any of that new gear out that surely has thousands of transistors and hundreds of chips (?).

I chose the 813s and 811 and GG amps because both the 813 and 811 don't really need cooling fans (I hate blower/fan noises) and grounded-grid amps are notoriously stable (no neutralization headaches), and they are pretty cheap. I have several 813s, some made in China; one of the Chinese 813s had a filament that opened up on me all by itself after very little use (don't know if that is THEIR quality control or just a statistical fluke, but I thought I'd pass that along to y'all). I also manage filament warmup and cooldown on the 813s with a variac (up and down over abut 5-10 seconds), but not on the 811 amp. Been using the 813s + 811 for over a year (using the Icom 707 as driver) and just love how nice and quiet it is without fans/blower noise.

Almost all of my old rigs are also pictured on that URL, and a couple of pictures of my "secret lab" out in the garage (heated with a space heater in the winter, cooled with a small airconditioner in the summer).

I started as a novice in 1959. Had a Knight kit T-50 and Knight R-100 receiver, later got a DX-40. Mostly liked to ragchew with locals on ten meters AM at the time. Lots of find memories. Lots of SWLing.

I'd like to hear from other homebrewers, HFers, ragchewers and learn if ther are any 75 meter nets for homebrewers/tubers/etc. I look at all this new gear coming out (for thousands of dollars) with hundreds of buttons, knobs, and "thangs" on them, and big thick manuals you have to read to figure out how to push the buttons (once, press twice, press and hold?, press and hold one, then turn on the power switch? Etc? Secret "reboot" buttons hidden somewhere. Built in DRM, DCMA, spyware? Too?). What happened to old-fashioned skill? 50 years ago guys worked the world with a crystal and a single 6L6 and straight key. Now, they are all couch potatoes in front of a black box that looks like its from outer space. ;-)

I figure I'm within a week or two of getting the homebrew SSB exciter actually on the air. I've been testing the outputs of various stages either using the Icom 707 as general coverage receiver, one or two oscilloscopes to check generated signals, etc. Still have a lot of tweaking to do. Its been a ton of work, debugging and rebuilding when something doesn't work, but its also been an incomparable sense of accomplishment, too, when I get a stage to work and make progress (four steps forward, three steps backwards). Its also nice to have some test equipment (generators, meters, a good oscilloscope [had a Tektronix 922 that gave up and I tossed, then a heathkit which had a dead vertical amp that I fixed, and a BK-1420? very nice but now the horizontal sweep died but vertical amp still good, so I can probe at least for RF which gives me a vertical line [keeping the test equipment going is also a problem], and all of that stuff is also 30+ years old).

After that, I plan to build a tube receiver and maybe even build a crystal lattice filter, and try to build a stable VFO.

It is great to know that I am not the last dinosaur left on the planet.

Although my call goes back to the 1950's when I was very active with all home brew equipment, there has been a period of inactivity with family and other hobby interests (such as aviation) and I have kept amateur radio as my real retirement activity.
With commercially manufactured equipment now mandated here for foundation licence applicants my greatest fear is that we will lose our greatest priviledge of being able to design and build our own transmitting equipment.
My first SSB transmitter was, of course, all valve. It started at 483Khz with a phasing system followed by two half lattice crystal filter sections. Output started as a 6146 and then grew to 4x811A's in parallel. One of the real problems was getting the VFO really stable and the best I came up with used the worm drive capacitor out of one of those TU6 tuning boxes with the tuned circuits connected remotely via coax lines to the oscillator stage which was on the main chassis.
All a long time ago but I still believe that such experiments were a good way to learn and am also of the opinion that the newcomers who simply purchase a commercial rig are missing out on a lot of the basic fun that we had when a piece of junk disposals equipment could be transformed into something useful.

Good luck to you Art, hope you continue to enjoy the hobby

==============================
50 years ago the bands were sooooo quiet (relatively speaking) that you
didn't need today's sophistication
Although even today ,by using QRP equipment ....and Morse
telegraphy.........simple gear can still give a lot of enjoyment,  but
in 20 - 30 years time ,how many hams will then still be using Morse code?
But as far as 'local ragchew' is concerned , I agree with you ,simple
homebrew gear will still do the trick .

===
Firstly , Foundation Licensees in the UK are permitted to use
self-constructed transmitting equipment from an 'approved kit' ,
whatever that 'approved' means.

The younger generation(s) are no longer interested in our hobby for all
the well known reasons, Internet- Mobile Phones - Sat TV - iPod etc.
Their first priority is 'socialising'   and a 'nerd' sitting in a shack
soldering and using test equipment is NOT socialising.
Moreover ,homebrew equipment is NOT necessarily cheaper than
off-the-shelf stuff (with the exception of very basic equipment and
peripherals).

Being involved in assisting people to get a Ham licence , most if not
all recruits are retired or are about to retire.

We now live in 2007 and beyond ....that's the reality .

However ,being an old fogy myself .....I still do enjoy home-brewing.

Frank   GM0CSZ / KN6WH   north of Scotland

Well, all humor aside, I stand by my original answer to BE CAREFUL.
True, a KV might not kill you, but if you start out being careless, when
you progress up to tubes like a 4-1000A, the B+ will most certainly kill
you. The pile of ashes on the floor will be proof enough ;)

Again, humor aside, I pride myself on NOT having hit a KV...that takes
more skill than hitting it ;)

See quoted material at end.

When I was a kid, I and the guys I hung out with were always playing with high voltage. We all built Tesla coils (12-15" sparks), played with Model T Ford spark coils (2" sparks), neon sign transformers that weighed 50 pounds and put out 15,000 volts at 30 to 50 milliamps, and Frankenstein-type "jacobs ladders." We made sparks. We made arcs. We made noise. We made smoke. We blew fuses. One more thing we all made was an old fashioned "repulsion coil" (coat hangers, wire, copper or alluminum ring that would jump up a foot when you threw the switch). We all made crystal sets, too. Made one transistor radios, too. Built Knight kits and heathkits.

Yes, you do NOT want to be a _klutz_ and goof off like we did. Yes, you do not want to play "electric chair" with yourself, and yes, its a very good idea when working with lethal voltage to keep one hand in your pocket when anything is "live". Repeat: if you are a klutz, or accident-prone, then do not mess around with this stuff.

Beyond that, yes, I got a few shocks. I even felt current from a 12 volt car battery (moist hands, large metal electrods, and use one hand on each, squeeze tight, I felt a mini-tingle). Got a nast RF burn by accidentally touching the plate cap of a 6146 with 50 watts of 10 meters carrier. It hurts and burnt flesh (part of my thumb) stinks like hell. I got a few more shocks, all minor, and whenever I'm around serious voltage and power, I definitely look twice at everything.

Most scandalous shock: Outside the house. Rainstorm coming and lightning and thunder comes 10 seconds later, means its all about two miles away, and I'm playing with the feedline on a 75 meter dipole with my hands, and then the next flash of light from the lightning and--dang it--I felt that "needle" in my hand from a pulse of electricity. Hmmmm...better get inside the house. So, next time you are listening on HF and when the lightning and thunder are close, and your S-meter needle is bouncing all the way to the top, you can be thiking about 100-200 volt pulses, eh? Anyway, just think about Ben Franklin who was flying his kites in the rain (in my case, I was dry and the rain wasn't falling yet where I was).

Yeah, I go to the local QCWA monthly lunches and what does everyone talk about? Not ham radio (but everyone has a ricebox), but their medical problems. Lots of them.

> With commercially manufactured equipment now mandated here for foundation

That is really sad. So, along with Microsoft as ultimate software robber-barron, we all become slaves to "commercial" interests.

Soon I will approach this problem. I may end up with a bank of crystals with a small variable capacitor to "warp" the crystal frequency. Free running oscillators are very hard to stabilize. The other option is to just leave them turned on, 24/7, so they are always warmed up.

> All a long time ago but I still believe that such experiments were a good

I agree 100%. I grew up in the 1950s and we had Popular Science, Popular Mechanics, and Mechanics Illustrated magazines. All kinds of do-it-yourself projects, diagrams, how-tos, everything. I loved it.

Today, its all "appliance operator" stuff in a throw away economy. It makes no sense to me.

> Good luck to you Art, hope you continue to enjoy the hobby

Thanks for all the good words.

One more thing: "Long live dinosaurs!"

I am retired out in the country (nearest town is 7 miles away, nearest
traffic light is 2.2 miles away). here, now, in the summertime, my
background static noise on 75 meters, believe it or not, is usually about
S 1 to S3. Only when we have thunderstorms does it get up to S 9 or more.
Yes. Believe it or not.  A guy I ragchew with on 75 meters lives in the
city. His noise is never less than S8 and quite often 20-40 db over S 9,
and he can't find the source.

> Although even today ,by using QRP equipment ....and Morse

It will be like slide rules and logarithms: forgotten. If teh kids can't
find the answers on the internet, then the project just will not be done.
And, they are still trying to figure out how the Egyptians built the
pyramids.

> But as far as 'local ragchew' is concerned , I agree with you ,simple
> homebrew gear will still do the trick .

Yep.

> Frank  GM0CSZ / KN6WH         north of Scotland

Good luck with Gordon Brown!!!

Right. Today's business model is profits. You don't need brains,
knowleddge, or skill to _buy_ an already assembled gadget. Just money (or
debt).

> Moreover ,homebrew equipment is NOT necessarily cheaper than off-the-shelf
> stuff (with the exception of very basic equipment and peripherals).

Best to look at hamfests (don't know if you have these over where you
are), used equipment, and war surplus (we have a few left here in US).

> Being involved in assisting people to get a Ham licence , most if not all
> recruits are retired or are about to retire.

Knights of Olde Times had scars to prove their courage, bravery, and
skills and slain dragons. ;-)   (or foolheartiness?)

Then thee can speak of "experience." ;-)

And, once burned, you learn and remember better, too!!! :-)

Memory is wonderful: You recognize when you made that same mistake before!

;-)

And, of course, you get bragging rights if you can talk about a smoke test
where you really did get the smoke (yeah, I had one and that burnt rubber
stank, too).

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed at me when he said this. During his "Who wants to be a Millionaire" TV show in March 1999, he said;

if you're watching the show jumping up and down screaming at the telly, remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help" were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

Nicholas Witchell - 10/April/1999

Certainty level: 100%

This clip is of Nicholas Witchell reading the BBC2 evening news at 7pm on Saturday 10 April 1999. You have to understand that the psychopaths of the Security Service consider their abuse of me to be "so funny"; and central to their persecution of me is their inducement of their "bought journalists" like the BBC's Nicholas Witchell to laugh at me on television.

So in this clip we see Witchell smirking and grinning while he reads the news. Only part of the news broadcast is shown in the clip; preceding it, Witchell's upper lip quivers in mirth for several minutes, until his entire mouth twists into the uncontrollable smile shown in this clip, through the excuse of a weak non-joke about sports fixtures.

"England expects every man to do his duty"

Certainty level: 90%

This video clip portrays a fairly-certain case of unpleasant MI5 harassment; because of context, surrounding events, not just this one happening. It's the first time an MI5 agent has been caught on video, and, presumably to their chagrin, their paid agent is either engaging in an onanistic practice, or, more probably, pretending to do so, in order to carry out an act of harassment.

The background is as follows. In late June 2000 I had posted the following message to Usenet, about MI5's making obscene noises at me on several recent occasions;

```
>From: bu765@torfree.net (Mike Corley)
>Subject: relax, don't do it (mi5 again)
>Date: 22 Jun 2000 00:00:00 GMT
>
>you will recall that a couple of weeks ago I was supposing what MI5 were
>doing with their 'single'handed' posting antics at 2am
>
```

>exciting stuff
>
>so about a week ago someone rings me up at home.... 'is that Emmanuel
>Goldstein?' then he phones back the following day and goes 'huaaaagh' on
>the phone before dropping the handset in excitement
>
>and a day or two later, just coming out of our house to put something in
>the rubbish bin, a pair of blokes over the other side of the road, again
>start making orgasmic noises
>
>I'm not paranoid enough to record minidisc when I pop out for a few
>seconds...... but perhaps I should be

The video clip, which was captured on 1/September/2000, is the culmination of that thread of harassment. You have to understand that MI5's abuse is in threads; they choose a topic, and then continue with it for months and years. Sometimes they drop a topic, usually to be replaced by a worse one, and you never hear of it again.

If the person in the video clip were not an MI5 agent, then he would deserve privacy, despite carrying out a real or feigned act in a public place. But I am almost 100% sure, because of context, that this man was one of their operatives, which removes any consideration of privacy from his act. He is facing away and cannot be clearly identified from this clip. I've never seen this man before or since, but that is true of most other such incidents.

C4 SnowMail - January/2001

Certainty level: 50%

In January 2001 I signed up for Channel 4 TV News's email service SnowMail, under an anonymous email address.
Quite soon Jon Snow and others started getting at me in the SnowMail bulletins, so I promptly unsubscribed.
Here are three distributed messages which may be intended to be against me; I have given these items a joint
probability of 50% only, since it is quite difficult to be sure these are against me, although I think they
may well be.

First item is from 5 January 2001. "Back passage contacts" might genuinely be about Labour were communicating
in a shielded way with ITN; but it may be about Snow's covert communications with me on his programme and in
this bulletin; and it's a slightly strange thing for him to say, it suggests the human body's back passage.
"I wish they'd come and talk on our website".... Snow knows I'm subscribed to his mailing list, and he may be
encouraging me to talk to him by email; again, if that comment were genuinely about Labour, then it would be
a strange thing to say, since the politicians talk to Snow by phone and on his programme, so they wouldn't talk
to him by email; my suspicion at the time is that he was trying to persuade me to talk to him by email,
so he could decently lie that my thoughts of reference were incorrect.

MIME-Version: 1.0

January 5, 2000

Good afternoon dear viewer,

Well the 'snowmail' drew a little ire from Labour HQ yesterday. A sensitive call at 6.35pm from my friendly mentor there sought to correct the impression I gave in yesterday's missive that in some way Labour was bounced into naming these latest millionaire donors. Well I'm afraid they were...rest assured Paul Hamlyn would not have been named without the diligent sleuthing of my colleagues, and had HE not been named neither would these latest two.

The only serious inaccuracy I must plead to was the promise that we would put these matters to a 'senior Labour person'...alas none was forthcoming...I shall make no such rash promise again. My same mentor was on the phone again during last night's Channel 4 News urging us to 'get some reality into the programme'. I fear we may have touched a sensitive nerve...and the election campaign has not even started, or has it? I shall try to keep you posted with these 'back passage contacts' as the campaign unfolds..from all sides. I do wish they'd come and talk things over with all of us on the web site...here's an open invitation...

So to today:

Harold Shipman murdered as many as 250 people it now turns out. But he is never to be tried and relatives who seek closure to their uncertainties will never reap satisfaction..we have the DPP, the Chief Medical Officer and a solicitor for aggrieved and bereaved families on the programme..the world's second-worst mass murderer..can he be allowed to escape further action?

Sending private/sexy emails in company time gets workers the sack..Big Brother spies on office premises..is electronic life in the work place getting out of hand? We explore what we can...and if you are not sure what you can and can't send, our site spells out the legal dos and don'ts and gives you the chance to put your views to us.

The CIA publishes its risk assessment for the world in the coming years..beyond the CIA itself, what's the biggest threat to life and liberty? Find out on Channel 4 News..and a major encounter with a man expected to take a top job in the Bush administration...

And a sumptuous piece from Nicholas Glass in Valencia..a city transformed by a brilliant young architect for half the price of what the Dome cost us.

Lots moving, see you at 7.00,best as ever,

Jon Snow

The next contact was on 11 January, with the unsubtle words "the lunatics have taken over the newsroom" from Krishnan GM. The phrase needs no explanation as to why it might be a dig at me.

From: "Guru-Murthy C4N, Krishnan"
Subject: Channel 4 News briefing
Date: Thu, 11 Jan 2001 16:56:25 -0000
MIME-Version: 1.0

January 11, 2001

Good Afternoon. Jon's away so the lunatics have taken over the newsroom. I am joined by Samira for tonight's show.

The Depleted Uranium confusion deepens. What did Ministers and senior officers know about the risks to soldiers? What did they tell others? And why the lack of candour over the recent documents that have surfaced? Having dismissed the army report leaked yesterday warning of the dangers of exposure to DU as written by a trainee and littered with mistakes, the Ministry of Defence now accepts it was written by an experienced officer. But they won't say who. More awkwardly it emerges that senior officers decided a month after it was written that the report should be circulated to all personnel likely to come into contact with DU. But was it? Nobody seems to know. Our Science Correspondent Andrew Veitch has also visited the lab in Oxford that could begin testing veterans for Depleted Uranium within six months, but they have had no contact from the government as yet. From the Tories, Mr Duncan Smith is likely to join us. And we have Defence Secretary Hoon coming into the studio to answer the obvious (and not so obvious) questions.

No interest rate cut today from the Bank of England, but could it be next month? As real fears are raised about the likelihood of recession in the US how could it affect us over here? There's been a recent consensus that Britain could weather the storm instead of falling into the usual pattern of shadowing American trends. But how realistic is that? And what about all that inward investment we rely on from the States? Liam Halligan has been looking at just what impact economic downturn across the water would have on us.

The former Bosnian Serb President Biljana Plavsic pleaded not guilty to charges of warcrimes including genocide today. She was number two to Karazdic and a reputed hardliner during the "ethnic cleansing" of Bosnia. But has a deal been done on her sentence if found guilty? Just why did she get on a plane and give herself up to the Hague War Crimes Tribunal? Nobody seems to have any explanation. Her lawyers are asking for special accommodation and even the possibility of bail. Gaby Rado is there and joining us live is the first Prosecutor in the Hague Judge Goldstone to discuss whether plea bargains and deals are the only way to get the real villains.

Also the astonishing news that scientists in America have bred the first genetically engineered monkey. What will they be used for and what's the next step? Does anybody really believe they won't do it to humans before too long? Julian Rush will have details.

All that and loads more at seven. See you then, I hope. Krishnan.

The third and final item is from 24 January, shortly after which I unsubscribed from SnowMail. Again, it is difficult to be sure if this item refers to me; it may do, it may not do, 50% captures the possibility. Snow refers to "third leg of [Blair's] political footstool". In English culture "third leg" indicates one's male member; Snow's phrase may be a sexual reference, of which there were others around that time.

January 24, 2001

Good evening dear Channel 4 News viewer,

There are times in this business when you suffer severe attacks of deja vu...haven't I already said "Mandelson Resigns!"...I'm afraid I have, and tonight I shall say it again. He's gone, the fat lady has not only sung but died completely and utterly on his career...that is the end of the former Northern Ireland Secretary's political career.

It's a body blow against Blair for whom Mandelson was a mentor, manipulator, calculator, friend, brother and the third leg of his political footstool.
It's a body blow for a Prime Minister who has had to have him resign not once but twice. It calls into question Tony Blair's judgement. Mandy, probably one of the most brilliant spirits in politics, flew too close to the sun...suffering finally at the hand of his own diabolical flaw.
Amazingly it's a flaw Blair understood more keenly than anyone...

And then there are the Hindujas who have compromised every political party with

ridiculous photographed party poses..who are they and how do they work?
Masses moving on all fronts on this story tonight. We have the resignation speech in full on our site www.channel4.com/news;
if you want to see how Mandelson bowed out.

There are other developments:

The cancer tragedy at Nottingham Queens medical centre..the wrong drug going into the spinal column of an eighteen-year-old
Leukemia victim who's now in intensive care, dangerously ill...it's happened before..why has it happened again?

And a moving interview with Sharon Sage who's mother Lorna Sage wrote a spell binding memoir highly rated in last night's
Whitbread Prize. An exceptional piece....

A highly political night....see you at seven on four...best, as ever, Jon

After this email I unsubscribed from SnowMail. I could not be sure that these items were or were not about me,
but it's an unpleasant feeling that Mr Snow might be getting at me in writing, as he certainly was when he watched
me while presenting the news; so I cut my losses, so to speak, and bailed out.

BBC-TV "See You, See Me" - 7/Dec/2001

Certainty level: 80%

On Friday 7 December 2001, BBC Schools aired a TV programme from their "See You, See Me" series.
The series was based in Scotland, with Grant Stott and Wilma Kennedy trying to find some stolen jewels.
Its web home is www.bbc.co.uk/scotland/education/seeyouseeme/

The programme appeared to make some "subtext" references to my situation. Kennedy refers to "it's not fair",
which is a key phrase; its existence started with OCTS MD Hugh S.-W. who humorously referred to my treatment
with the same phrase.
The subtle statement is that it is fair, because we're doing it, and we're always right, even when we're wrong.

The phrase "useless idiot" from the police chief is a clear insult directed at me, and needs no explanation.

But it is the third item in this clip which is most telling. Stott says the words, "humiliating in front of
the whole public, it would crucify us" if the investigation were called off. That's the phrase that assures
this clip of an 80% probability rating. MI5 are trying to humiliate me "in front of the whole public",
and their strategy is a mixture of ambiguous covert, such as this very programme, and clear overt.

Channel Four TV News - 10/April/2002

Certainty level: 80%

I was watching Jon Snow on Channel Four TV News on Wednesday 10 April, and he again reacted on seeing me watching his programme. At 7.25pm he was reading an item on atrocities during the Balkan war;

JS: "It was Europe's worst massacre since the Second World War, and Dutch army officers [cough] and the United Nations should share the blame. So says the first authoritative report into the murder of thousands of Muslim men in Srebrenice at the height of the Bosnian war in 1995. The 7,500 page document took Dutch Government researchers six years to prepare, and it condemns military and political leaders for sending peacekeepers on a mission impossible. Our Foreign Affairs correspondent Gaby Rado, who went to Srebrenice very soon after the massacre, is with us now. Gaby, how damning is this report?"

GR: "Well it is very severe. It accuses the Dutch Government of sending badly armed and badly briefed Dutch soldiers into a very dangerous space out of a sense of national arrogance basically. It accuses the United Nations basically of..."

There are two incidents in this one recording. The first (80% certainty) is when Jon Snow develops a frog in his throat in the first sentence, shortly after reading the text "Europe's worst massacre". There is both verbal expression and facial expression at that point; he is laughing at me, which is at odds with the serious material he is reading. His eyebrows twitch upwards, and he is smirking at the phrase "Europe's worst massacre", and its application to the Security Service's actions against me. Another aspect is that when Snow said "Europe's worst massacre", I facially reacted; in return, Snow would have seen my change of expression, and followed it with his own reaction. He almost says "United States" instead of "United Nations"; he isn't looking at his autocue, his mind is off what he is reading, instead he is looking at me in the little monitor where he sees me through the television.

The first incident I'm fairly sure about, but the second I only give a 20% certainty to; it's when Gaby Rado talks of a "sense of national arrogance", supposedly about the Dutch, but perhaps the English actions against me for over a decade. If Rado's statement were about me, then it would be condemnatory of MI5 as being "arrogant"; but I cannot be reasonably certain it's about me, or much less so that Snow's reaction in the first instance, anyway.

BBC1 TV News - 18/Dec/2002

Certainty level: 30%

This item occurred on Wednesday 18/December/2002, on BBC1 TV News shortly after 6pm. It is one of the "coincidence"
category of happenings, where people by supposed coincidence repeat exactly the words I have said or thought very recently.
In this case, the BBC's New York correspondent Stephen Evans, live from NYC, says the words "airy fairy language",
during a piece on Britain's entry in the competition for a successor to the WTC after 9/11.

I had been thinking the words "airy fairy" a day or two previously and may have spoken them in my sleep. I did not speak them awake.
The TV practice in 1990-92 had been to repeat on TV/radio (or at work) words which I had either spoken while awake, or words I had
thought but not said consciously - since I know that I sometimes say things in my sleep, but cannot later recall saying them,
obviously since I was unconscious at the time. The TV news reader or reporter then finds a context in which to drop a particular phrase;
this practice has a famous exemplar in the "Phil the Greek" item relating to the Duke of Edinburgh - who had been called Phil the Greek
in Private Eye, then a TV reporter managed to structure his report to include the words "fill the Greek community with alarm".
It might appear funny, but when such "intentional coincidence" happens a lot, as in 1990-92, and when it supports other methods of obscenity,
then the amusement value wanes.

The choice of words appears to form a homosexual reference - the way it works is that the Security Service are blokes fantasising continually
about another bloke, so to avert the obvious observation of their being gay
see here for another instance of unwholesome MI5 fantasising in public),
they try to assign the attribute to the victim - they do this sort of thing all the time, with all sorts of attributes. However, in this
particular case I give it only a one in three probability, since this incident seems to have been a one-off at that particular time.

Life is so hard

Certainty level: 100%

This relates to harassment at my workplace in Canada. Yes, "they" had their claws into my employers in North America, it doesn't just happen in England, it happens here as well.

During the second half of 1996, at work, I was sitting near a co-worker whom we shall call Mark (we can, because that's his name). This guy occasionally came out with words and phrases that made me think that "they" had got to him and were supplying him with information about my home life (not social life please note, because of course I don't actually have a social life here).

During November 1996 I tried to catch him in the act of saying something "meaningful", a difficult exercise because as soon as he saw a tape recorder, he shut up completely, except for times when he knew he would be out of range of the walkman. (Note that the quality of this recording is not very good; I was just using a four-year-old tape walkman with a cheap microphone, quite low-tech).

During the evening of 12 November 1996, at home in my apartment (flat to you UK-ers), I said "life is so hard, and then you die". A nihilistic, negative thing to say, but quite distinctive. The following day, 13 November, Mark said loudly, "life is so hard eh, and then you die" followed by loud laughter.

In my book the precise repetition of the words makes this incident a 100% certainty. You, the reader, may differ, but then living in a free country allows each of us to have our own opinions, doesn't it?

GLR-David Hepworth (21/Feb/1997)

Certainty level: 80%

I was listening to BBC Greater London Radio (GLR) by stealth, ie. on my walkman with headphones, with the sound turned right down, to prevent anyone from hearing what I was listening to. Yet somehow "they" are still able to tell what station I am listening to on the walkman. After half an hour or so listening to GLR, DJ David Hepworth came out with this;

"I assume Brian, do we have an embarrassment of prizes in there, we do, don't we, absolute obscene amounts of prizes, there will no doubt be a riot at the back door, and that's A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasised verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasised) described the disgusting sexual abuse which the harassers have been throwing at me.

Of course, I can't prove that this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. I sent David Hepworth a copy of this explanation, with the results listed in a subsequent item (David Hepworth 9/May/1997).

At least in Europe AC/DC radio and television receivers were common, in which you could have the 220 V mains directly in the chassis. You learned quite quicly to check the polarity of the mains plug before starting serving such equipment.

There was a golden rule of always keeping your left hand in your pocket while working with your right hand inside a mains powered or high voltage device. An AC/DC powered device could deliver quite a lot current through the mains fuse and rectifier. If you touched some high voltage part (possibly causing a cramp in your hand), the current would not go through your hart and you would have the other hand operational to pull the plug.

When testing a new power supply, I was sniffing around to detect any overheating components, my nouse touched the mains transformer primary and got an electric shock in my nouse. I did not notice anything special after that, but driving a car immediately after that proved to be difficult, since I really had to concentrate to stay in the lane.

So if you get an electric shock in the head, nouse or ears, please avoid driving a car for a few hours, at least for the safety of others using the road :-).

GLR-David Hepworth (9/May/1997)

Certainty level: 100%

This time I deliberately listened to Hepworth with the sound turned up on the radio, to try to get a reaction. Sure enough, he and his cronies reacted;

David: "we have executive drivetime, and we have Brian in charge of the prize cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David in fact it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know if you remember him obviously still alive and kicking.... and that's just in my left hand"

David: "So it's certainly worth competing. Rock and roll spelling test is your first opportunity to take advantage of this embarrassment of prizes"

What I "read into" this item should again be quite obvious. Remember, I sent off a letter of complaint to Hepworth after his spying activity during the previous show. Here the emphasis on "absolute embarrassment" of prizes shows he knows this is a "key" phrase.

It might be interesting to try to talk to DJs like Hepworth and ask them what they get out of abusing their listeners. But if you challenge them directly, they show their true colour (yellow) by either not answering the challenge, or by denying that harassment has taken place.

Capital Radio (11/April/1997)

Certainty level: 10%

A nice easy one here. The DJ is heard to say (around 8.30pm);

"Jacko in town, what a gig it's going to be, that guy is amazing, and psychotic, but amazing on stage, 0171-420-0958, on stage he's a madman but he's wonderful"

I was listening to Capital loud and clear, trying to get a reaction. The above may have been a reaction. I'm not sure if it was, and I'm not sure that it wasn't.

Neil Fox's Juke Box on Capital Radio (week ending 15/March/1998)

Certainty level: 70%

Here is an excerpt from Neil Fox's show on Capital Radio 95.8FM, sometime during the week ending Sunday 15/March/1998 (probably during the weekend, but I don't remember).

First I will give the text of the conversation between Neil Fox and telephone caller Martin, then I will state my interpretation.

(conversation) (F=Dr Fox, M=Martin the caller)

F: coming up on the jukebox, the hotline's 0171-4848-958, just a quick shout here and so who's this going to be then Mr Producer?
(staff, shouting) MARTIN!
F: Couldn't quite hear you, it's going to be?
(staff, normal voice) Martin.
F: Thank you. Martin, hello.
M: Hello, Foxy.
F: How are you Martin.
M: Er, knackered.
F: Why?
M: Didn't get much sleep last night. Party down the road.
F: What time did you go to bed?
M: Four o'clock this morning.
F: Well that sounds quite a reasonable Saturday night if you ask me.
M: I was up at eight.
F: You were up at eight this morning?
M: Yeah.
F: That's sick. Why? What on earth made you get out of bed at eight this morning?
M: My father.
F: Well that's no good. Why is he being sicko, is he being a sadist?
M: No, he out there, sort of clearing room.
F: Listen, is your dad there?
M: No, he's downstairs.
F: Oh mate, can you get him?
M: No.
F: Does he not let you on the phone? The only reason is that I wouldn't mind having a chat with someone who makes anyone get up at eight o'clock on a Sunday morning. I'm sorry, that's ill isn't it, that's out of order.
M: It's sick.
F: I'm just going to ask around here. What do you think then, eight o'clock Sunday morning? That's out of order isn't it, for any father?

(staff) Yeah, definitely.
F: Is he like victimising you or something, is there any reason why he wanted you up at eight o'clock? To clean your room?
M: Well as I say I got up at eight this morning to clean my room and it looks worse that it did yesterday.
F: Well I should have just left it and stayed in there until eleven o'clock if I was you.
M: Well I was up, I didn't get out of bed.
F: What, you didn't get out of bed at eight o'clock? No, he woke you up at eight o'clock. Did you do any cleaning at all?
M: I haven't touched my bedroom.
F: Top man. Boy you're going to get your arse kicked later aren't you. Now a song for you, what can we play?
M: Guns and Roses, "Sweet Child of Mine".
F: And we're going to dedicate this to your father?
M: No we're not, we'll dedicate this to my good mate Jamie, who's sitting on the bed now.
F: Right, hello Jamie. And anyone else? Any top totty in your life at the moment?
M: Unfortunately no.
F: The totty factor is quite low at the moment is it?
M: It's dead.
F: It's dead? What, nothing?
M: Nothing.
F: What, zero? Well, that's pathetic. No wonder you're down. You stay out til four o'clock and nothing. We'd better have words when we're off the radio I think. We need to give you a team talk. You have a good night tonight.
M: And you.
F: Take care.
(song starts)
F: Actually something was going through my mind. I think I'll leave it.

I'm not really sure whether this is in any way about me. It probably isn't. Probably it's just my nasty suspicious mind finding links where none exist. However, here is an explanation of why it might, possibly, be about me.

Throughout this interview, I was throwing abuse at the radio, and to my mind, Neil Fox was hearing the abuse, and responding interactively. This explains why he sounds so stressed when talking to telephone caller Martin, and the general violence of his words including "Boy you're going to get your arse kicked later aren't you".

The piece starts of with the producer shouting the name of the caller, which might be related to my loud vocalisations at the radio. The trouble starts off with Fox saying "That's sick". "Sick" might be taken as a reference to my condition. Then Fox says, "Why is he being sicko, is he being a sadist?", again sick = my illness, "sadist" = attitude of my oppressors towards me. "that's ill isn't it" = further comment on my illness. "Is he like victimising you or something" = again what my enemies are doing to me.

Fox sounds quite happy when he gets Martin to say "It's sick"; as you would expect him to, if the comment were directed at me. It is a constant feature of my enemies' harassment of me that they get intermediaries to verbalise the abuse. Immediately after saying "victimising you" Fox gives a little laugh, to show he thinks the victimisation (of me, not Martin) is funny.

Fox gets increasingly nasty as the piece progresses. "Boy you're going to get your arse kicked later aren't you" is not really what you would expect him to say if he were just talking to Martin. Fox is on the same side as Martin, so why would he be so verbally aggressive to him? On the other hand, if the piece is about me, then his strong words start to make sense.

Fox's jubilation at finding that Martin's "totty factor" is "dead" again doesn't make much sense unless you think that he might not be considering Martin's totty factor, but mine, since it's a fairly well known fact that my "totty factor" is not significantly above zero.

To round off the 135 second interchange, just as the next track is starting, Fox says, "Actually something was going through my mind. I think I'll leave it". Given that I was chucking abuse at Fox throughout, it is only natural for him have thought up a reply that he would have wished to have made, except that such a reply would (a) probably not be suitable for a family show, and (b) have given the game away completely.

So there you are. You the jury, what say you in the case of plaintiff vs. Neil Fox's Juke Box, guilty or not guilty?

Three of us? Could we form a club? "The dinosaur club"? ;-)

I'm kinda half serious, though. I go through QST and they have this "Old Radio" department now. But its also almost all old _commercial_ gear.

I'm looking for those guys who built all those rigs that appeared in QSTs, CQs, etc. If they are still alive.

I've got probably 100+ myself. Constantly looking at my tube manual and dreaming about the next project(s), whether I should use some tube or a different one, or maybe even something else.

I started out with mostly 7 pin and 9 pin miniatures, but now I'm pushing myself towards octals just for the ease of handling. The "key" means its very easy to get into the socket (get key in hole, rotate and ..click..push in). Besides, the socket pins are bigger, easier to solder. And, since the heat is spread out more, the tube runs cooler so you don't burn yourself when you go to pull out a hot tube to check another of the same kind. Takes up more volume, but, what the hey, I build this stuff spread out for ease of repair, ease of construction, modification.

FYi, FWIW...

I just noticed something about the 4D32 transmitting tube.

It looks like the suppressor grid is not connected internally to the cathode. This means it might be good for grounded grid HF amplifier service (being that grounded grid is so nice and stable).

The tube, electrically, looks almost like an 811 in plate dissipation (50 watts instead of 65) but, here's the good part, runs at 600 volts on the plate instead of 1200-1500 for the 811.

The 4D32 has 6.3 v filament. And, the 4D22 has all the same except 26 v filament (?), same electricals otherwise.

And, 600+ volts for HV is a lot easier to get than 1200-1500.

FYI, FWIW

Foxy's Showtime on Capital FM 25/11/98 7.35pm

Certainty level: 100%

This one, I can say with absolute certainty, is about me. It was recorded on my Sony Recording Walkman on the evening of Wednesday 25 November 1998. It doesn't mention me by name, so the objective observer might have trouble understanding why I'm so sure it's about me. I'm sure, because the harassment had restarted over the period when this piece was broadcast, and what Capital transmitted would have been in context with events at the time. (Sorry if that explanation is somewhat opaque, but I don't really want to embarrass myself by giving an explanation in detail, and an intelligent reader should be able to work it out for him/her self.)

This isn't the first time Capital have "got at" me; they were doing so right at the very beginning in summer 1990, when they said, "if he listens to Capital then he can't be all bad"; and Tarrant made remarks about me in his breakfast show in spring 1994, when he said, "you know this bloke? he says we're trying to kill him. We should be done for attempted manslaughter."

Unfortunately I didn't record those previous, much more conclusive instances of harassment by Capital DJs, and Capital Radio tells me they only keep recordings for three months. But lately I've been recording everything, and here is one product of that recording.

Neil Fox was introducing some petite Swedish songstress, sounded like Amelia, when he said something about her petite-ness ;

"she's a big big girl, actually she's really about tiny, she's this big, would you say what less than....."

then one of his studio staff shouted, "six inches"

then Fox laughed and said, "less than a meter tall, definitely"

What I think the "six inches" referred to should be obvious. I think it's sexual abuse directed at me.

Also there were a lot of words like "crazy", "mad" etc on this programme, which reinforced my belief that this was on purpose directed at myself.

I think Fox may be something of an unwilling participant in this abuse, he doesn't want to be an abuser but the persecutors are using his show and his staff to get at me. This is not the first time this sort of thing has happened from his show; and my guess is that it won't be the last

I'm looking for a small (1� inch square or smaller) 100 micro amp meter. I've looked around the web and at some part suppliers sites without any luck. Is there anyone who could point me to a source? I don't need a high accuracy unit 5% or so is good enough.

Thanks,
Danny, K6MHE

Hi,

Have you tried Mouser.com or Digikey.com?

You could also scavenge a VU meter from an old stereo or tape unit and
make your own scale. Usually they are 1mA, but sometimes, especially the
older ones, are 50 or 100uA.

Cheers!

I have a WJ M14 mixer with sma connectors on all three ports. Does anybody ant data on this mixer? A search on the Internet didn't turn up anything and I get no response from the company even after using a professional for pay search service contacted them.

It truly is unfortunate if WJ is now unresponsive; in the '70s and '80s I often wrote WJ requesting data on many products, including mixers, and always received a reply with copious amounts of material including spec sheets, manuals, etc.

How times change...

Regards,

Michael

Probably only those that were unprotected by expensive semiconductors.

Hi Ken,

AD9912 and the others, are expected to be released during sepember.

I2CG has done some additional tests usign a R&S 2GHz signal generator
as clock and it looks like the 9912 can be driven to nearly 1.5GHz, so
1.2 to 1.3GHz clock could be suitable.
Now we have to find a low phase clock generator around 1.0 to 1.3 GHz.

I built a couple of their kits - and they worked for what they were intended to do. However - a friend of mine built a "receiver" kit - and it really sucked. He called Ramsey to see about getting it "repaired". They wanted like $75 to do so. He paid almost $50 for the kit. He didn't feel like shelling out another wad of cash - so he junked it.

All I can say is ask them about their repair/replacement issues first - decide if you want to proceed - especially if you're not that skilled in electronics. Good luck!

Mike;

Thanks for the links. I don't need a substitute part, I have two of these
mixers I picked up at a fleamarket.

: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says and on their posting patterns. I don't think "The Internet" (capitals, no less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't mind having it explained again to you, do you now?). The reason my "symptoms" are such a perfect fit to the textbook is because the people causing the campaign "fitted me up" in such a way that what they did would resemble the symptoms of schizophrenia. Hence TV, radio, other media, people in the streets etc. By a fortunate coincidence (for them) these mthods of harassment are the ones which offer easiest channels of access (for them).

It's really quite neat. All it takes is for people to start believing that the "symptoms" aren't symptoms but reality, though, and the house of cards collapses in a heap. And there are _lots_ of people now who knoiw full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd have to lock up a lot of people if sending annoying email was a crime"

"Er....."

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in Oxford, we went for a drink with the technical director, and a couple of other employees. The TD said in an "as-if" aside to one of the others, "Is this the bloke who's been on TV?" (he said it directly in front of me, and obviously meant mke to hear him saying it). The other person replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with him? He's so insignificant, why would they possibly want to spend the resources going after him and putting all that expensive technology in his home, when there must be much better targets?". The Technical Director was given to sometimes disrespecting people, you see, and in my case he couldn't see the point of anyone expending money on harassing me.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we

have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

Peter Ceresole (peter@cara.demon.co.uk) wrote:
: In article <Ds0L1o.BMF.0.bloor@torfree.net>,
: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin
: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what actually happened a few days previously, that it's completely reasonable to assume that someone told Levin about the meeting, hammed it up a little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but really we're afraid of him, or is it perhaps our own propaganda that we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I explained this nor my GP believe me either (until the friend found out otherwise!). If someone just presented this to you as I am presenting it now then I wouldn't find it credible (most likely), so it's not until you actually find out it's true that you can find it credible. And by then it's too late, because they've got you in their trap and explained how "funny" the abuse is.

Rots a Ruck!
 From the early specs looked like the chip has a built in PLL to
generate the clock from a lower frequency source. Phase noise might not
be as good though.

: Given other ways in which I have seen people exploit some of The Internet's
: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says and on their posting patterns. I don't think "The Internet" (capitals, no less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't mind having it explained again to you, do you now?). The reason my "symptoms" are such a perfect fit to the textbook is because the people causing the campaign "fitted me up" in such a way that what they did would resemble the symptoms of schizophrenia. Hence TV, radio, other media, people in the streets etc. By a fortunate coincidence (for them) these mthods of harassment are the ones which offer easiest channels of access (for them).

It's really quite neat. All it takes is for people to start believing that the "symptoms" aren't symptoms but reality, though, and the house of cards collapses in a heap. And there are _lots_ of people now who knoiw full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd have to lock up a lot of people if sending annoying email was a crime"

"Er....."

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in Oxford, we went for a drink with the technical director, and a couple of other employees. The TD said in an "as-if" aside to one of the others, "Is this the bloke who's been on TV?" (he said it directly in front of me, and obviously meant mke to hear him saying it). The other person replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with him? He's so insignificant, why would they possibly want to spend the resources going after him and putting all that expensive technology in his home, when there must be much better targets?". The Technical Director was given to sometimes disrespecting people, you see, and in my case he couldn't see the point of anyone expending money on harassing me.

: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we have only just reached the technical stage at which it is feasible, and we know video-spying is done to other people (NB the Diana-Hewitt episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social manipulation of many people by a concealed element in what other countries would be called the secret police. The most disturbing element is the degree to which people allow themselves to be unquestioningly manipulated by an evil element within the state.

Peter Ceresole (peter@cara.demon.co.uk) wrote:
: In article <Ds0L1o.BMF.0.bloor@torfree.net>,
: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin

: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what actually happened a few days previously, that it's completely reasonable to assume that someone told Levin about the meeting, hammed it up a little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but really we're afraid of him, or is it perhaps our own propaganda that we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I explained this nor my GP believe me either (until the friend found out otherwise!). If someone just presented this to you as I am presenting it now then I wouldn't find it credible (most likely), so it's not until you actually find out it's true that you can find it credible. And by then it's too late, because they've got you in their trap and explained how "funny" the abuse is.

Given that Mr Corley clearly holds a certain fascination for some people, and that his website, although "informative", isn't exactly ideal for encouraging discussion of the sort that we all enjoy so much (including Mike himself, by the look of things), would anyone be up for a Mike Corley newsgroup - uk.fan.mike-corley, alt.fan.mike-corley, whatever? (Sorry, I'm not very well up on these things.)

This would be a perfect place for Mike to post his writings, and perhaps the occasional "look at the ...mike-corley newsgroup" posting in uk.misc and so on would be accepted in place of the current cross-posts.

Sad, confused and emotional disturbed Mike Corley wrote:

{ snip }

Because he has made himself into a martyr and now he finds it impossible to back down. Mike's big secret has now been exposed. He made everything up.

Every time Mike makes allegations against the police, MI5, Tom-Dick-and-Harry etc. those organisations have taken people off vitally important work to ascertain whether or not there was any substance in Mike's ranting allegations.

When I'm told by someone who really does know such things that there was never any plot to get Mike then I trust that person sufficiently enough to accept his word.

The problem is Mike has escalated matters to an extreme level and like many silly billys he will find it impossible to give up all his self created crap and to live a normal life. After all what can Mike do now this crap has been exposed as untrue ? What new cause can Mike dedicate himself to ? (Some might read that as: who else can Mike now start upsetting ?)

So Mike write to John Major, c/o the Private Secretary, 10 Downing Street, London SW1A 2AA and ask the Prime Minister to help you. I'd normally disclose his fax numbers but if I did that you might jam up the lines with abusive postings just like you do here on Usenet.

Is anyone interested in joining with me to do a mass e-mailing of protests to Anon Penet and to Toronto Free Net in an attempt to flood their computer systems thus forcing them to seriously consider pulling the plug on Mike ? I'm not sure but is my proposal called a "flame" ?

> for email addresses.

Perhaps we should give Mike 7 days from today (6 July 96) to come to his senses and they start a massive multiple E-mailing campaign to Toronto Free Net. If all us victims send multiple copies of E-mails to the right addresses in Toronto then perhaps the Canadians will begin to get the appropriate message.

Copy e-mailed to Mike, just so he knows what is coming if he persists.

I see. So they're not wasting six years of manpower to persecute you. They're wasting six years of manpower to prove I'm _not_ being persecuted.

I wish I was clever enough to think of something like that. I really, really do.

>When I'm told by someone who really does know such things that there was
>never any plot to get Mike then I trust that person sufficiently enough to
>accept his word.

Come on "Big Ears", why don't you admit that you made this posting? This is exactly the same line you were feeding me a few months ago. The posts are from the same news server, it's even the same newsreading software (Forte Agent .99e/16.227).

I'm afraid that if you friend "in the know" denied the existence of a plot then he was being, as they say, economical with the truth. Judging by the extreme reaction in London in May, and the panic you're showing now, as well as the replay post yesterday, I would say that things are hotting up again. But for you this time, not for me. I am out of harm's way, and there is very little you can do as long as I stay out of the UK.

Every time Mike makes allegations against the police, MI5, Tom-Dick-and-Harry etc. those organisations have taken people off vitally important work to ascertain whether or not there was any substance in Mike's ranting allegations.

When I'm told by someone who really does know such things that there was never any plot to get Mike then I trust that person sufficiently enough to accept his word.

The problem is Mike has escalated matters to an extreme level and like many silly billys he will find it impossible to give up all his self created crap and to live a normal life. After all what can Mike do now this crap has been exposed as untrue ? What new cause can Mike dedicate himself to ? (Some might read that as: who else can Mike now start upsetting ?)

So Mike write to John Major, c/o the Private Secretary, 10 Downing Street, London SW1A 2AA and ask the Prime Minister to help you. I'd normally disclose his fax numbers but if I did that you might jam up the lines with abusive postings just like you do here on Usenet.

Is anyone interested in joining with me to do a mass e-mailing of protests to Anon Penet and to Toronto Free Net in an attempt to flood their computer systems thus forcing them to seriously consider pulling the plug on Mike ? I'm not sure but is my proposal called a "flame" ?

Perhaps we should give Mike 7 days from today (6 July 96) to come to his senses and they start a massive multiple E-mailing campaign to Toronto Free Net. If all us victims send multiple copies of E-mails to the right addresses in Toronto then perhaps the Canadians will begin to get the appropriate message.

Copy e-mailed to Mike, just so he knows what is coming if he persists.

I see. So they're not wasting six years of manpower to persecute you. They're wasting six years of manpower to prove I'm _not_ being persecuted.

I wish I was clever enough to think of something like that. I really, really do.

>When I'm told by someone who really does know such things that there was
>never any plot to get Mike then I trust that person sufficiently enough to
>accept his word.

Come on "Big Ears", why don't you admit that you made this posting? This is exactly the same line you were feeding me a few months ago. The posts are from the same news server, it's even the same newsreading software (Forte Agent .99e/16.227).

I'm afraid that if you friend "in the know" denied the existence of a plot then he was being, as they say, economical with the truth. Judging by the extreme reaction in London in May, and the panic you're showing now, as well as the replay post yesterday, I would say that things are hotting up again. But for you this time, not for me. I am out of harm's way, and there is very little you can do as long as I stay out of the UK.

It's that mad time of year.

Wanting to move up from my current Metron mobile amp what thoughts on basic layout of a 14v DC powered amp that could run the full legal limit?

Would you run say, 16 Toshiba 2SC2879 devices (within their total dissipation specs) to keep IMD halfway reasonable or would you consider an on-board switcher PSU up to say 80-100v to use some more modern FET's. Is this at all feasable?

Of course a 'stiff' DC supply is required whichever way you go and the extra few dB in signal is questionable as to whether it's worth all the trouble.

I think a Hi-Q antenna would handle the power so that's not a concern.

Your thoughts on "Son of Metron".

Phil G4ZOW

Can't disagree with that sentiment.

Wasn't it documented that MI5 sometimes "bought" journalists and broadcasters?
I remember reading a report by some jouralist who had been offered an extra
tax-free income by MI5 to become their covert mouthpiece, and had refused.

Bet you lots of others didn't refuse. Why do you think MI5 have such easy
access to the BBC and media? Because they're directly paying them off, that's why.

It has been reported several times. The most recent was in Private Eye,
a few months back. As I recall they also wanted information from him;
journalists would be a natural choice for members of the Security Service
and the Secret Intelligence Service for information sources.

> It might be interesting to see what he had to say regarding their
> attempt to recruit him.

He was most concerned that many others would have accepted such an
offer. However, we can probably make an educated guess as to some of
those who accepted: Nigel West (Rupert Allason, MP) and Chapman Pincher
would come near to the top of the list.

This is true. I frequently employ private detectives to spy on people (there's a good reason for this and I'll tell you if you guess correctly) and one such detective showed me the latest technology only last week. A small rucksack. One strap of the rucksack has a tiny hole in it that you wouldn't notice unless someone pointed to it. That's the camera: the wires lead into the rucksack itself where there is a video tape recorder little bigger than a Walkman. I don't know if that's what Roger Cook uses but it certainly explains why it is that the subject can look straight into the lens and not realise (s)he's being filmed. Now, I say "latest technology" and I think that's the technology that the police use as well as the retired police who become private detectives,

but no doubt the security services have far more sophisticated
equipment.

: >Corley's allegations are true, there needs to be evidence of two
: >things. Firstly, there must be evidence of subversive activity on
: >his part. Secondly, there needs to be evidence of MI5 taking
: >measures to counter this subversive activity, in proportion to the
: >magnitude of the threat posed. Upon reading Mike Corley's posts,

: Alan,

: What about the following scenario? MI5 conducts "experiments" including
: field trials of novel surveillance methods. Say there was a "research
: project" underway to see just how invasive a surveillance of an
: individual could be. Perhaps it wasn't research, perhaps it was for
: training of novice personnel. Either way, there is a sizeable risk of
: detection. In order to minimise the consequences of this, you choose
: someone who is out of the public eye, and if possible someone whose
: credibility is already damaged - by diagnosis of schizophrenia, for example.
: This will facilitate the "plausible denial" if something goes wrong.

: I think this would be closer to Mike's theory.

: Mike, if you are reading, please don't post the story again. Anyone can
: read it at [snip] if they are interested. Also, don't
: think that I actually *believe* the above. On cost alone, it is extremely
: unlikely to be true, and some elements of the story (people in the media
: being "in on it") are just too crazy (though I can see how the paranoia
: builds to the extent that you can see "them" everywhere).

My argument is that the fact that it's so totally crazy is what makes it so plausible and so hard to prove.

I shall continue to try to find ways to kick down the house of cards. Because it is a brittle structure. It only needs one person to corroborate, and then it's all over.

: P.S. Anyone else ever thought of "what-ifs" along the same lines? I
: remember as a boy daydreaming that maybe I was the focus of national
: attention in a "let's follow the life of one person from life to
: death" study - that while I was out or in bed there were programmes on
: the television about my life so far, etc. It makes for a good fiction,

Perhaps MI5 have become victims of their own paranoia. Their agency has been thought of as acting disreputably, so when their decision arrives, they don't think twice about breaking the law. Whereas say CSIS (the Canadian equivalent) is at pains to point out how it would never ever do anything in contravention of the law, and how it is strictly controlled in what it does and how it does it.

If this matter does ever make it into the public gaze, then it won't just be a few individuals in the media or security service who'll get hit. The UK is supposed to be a civilized democratic country (East Germany called themselves a democracy and they had the Stasi, but anyway). In a civilized country these things shouldn't be happening - and it is ultimately Parliament and the

government who are answerable for not imposing sufficient restraints and
accountability on those who are supposed to be ensuring security for citizens,
not jeopardising it.
....

I don't have florid symptoms. But I'm in a difficult situation, because those people who don't know, aren't going to believe, and those who do, they just go along with the crowd. It's never a good idea to go against the grain, and the grain here is defined by interests in the establishment and the media. Even people who could say out loud what was happening won't, because then there's a risk that they'll be seen as traitors and ostracised.

Usually this type of 'hidden abuse' is racial and targetted at a racial minority within a country. You keep the minorities out of the good jobs, but you don't admit discrimination exists. It happens everywhere, not just in Britain. The persecution that is going on now is in reality a refined form of racism. Instead of "nigger" it's "nutter", and abusing the mentally ill is still socially acceptable today. In 50 years it might not be, but today there isn't any social or legal sanction against it.

So really they've refined racial harassment down to a minority of one. The words may be different, but the methods are the same.

Considering he spammed it far and wide (well, at least to alt.angst and
alt.folklore.urban which I saw and each of those included other groups
in the Newsgroups line) I doubt he'll be seen anywhere for long. Using

the xs4all remailer doesn't really help if you post the url to a
web site which makes it clear who you are.

Nuala, who thinks that the sad thing is he used frames much better
than many sites done by supposedly 'sane' people.

Well, the "legal option" has just foundered on the rock of lawyers refusing to deal with me on the grounds that my perception of harassment must be due to the disease.

So we're back to square one again, the same place we were two years ago.

Now perhaps one of our uk.legal participants can clarify this point. To me it seems illogical that lawyers should have the final say on whether you are allowed to proceed with a civil case or not. Is there a default mechanism or agency for cases such as mine where it is difficult to find a solicitor to represent you? What exactly is the "official Solicitor"? What is it possible to do if you can't find a lawyer to represent you?

A chance to get a useful response out of the uk newsgroups! perhaps they can be good for something else besides spamming.

....

Represent yourself....like the defendants in the McLibel trial.
you will need to read some law..but you CAN legally represent yourself I believe.
Mike W.

....

From: burridge@osiris.win-uk.net (Paul Burridge)

Yes, a lot of people do this nowadays. Saves on legal fees too. Lots of reading up required first, though.

What can I do to get competent legal help though? If the case is on the face of it so bizarre that no solicitor would represent me or talk to me, then surely there must be a default mechanism? What is the "official Solicitor" that's been

mentioned?
....

All you need do is go to a good library & read up about it - that's what
the McLibel 2 did.

Subject: "Absolute Obscene" David Hepworth (GLR)
Newsgroups: uk.misc,uk.legal,alt.radio.uk,uk.media,uk.media.radio.misc
Organization: Toronto Free-Net
Summary:

Keywords:

Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that I was listening by stealth. Back in 1990 I used to have Capital blaring out of the speakers all over the garden ("if he listens to Capital then he can't be all bad", thanks ever so much). But now I listen on my walkman on headphones with the volume turned right down. It could not possibly be overheard by any listening device, no matter how sensitive, because sound does not carry from the headphones.

Yet somehow they are still able to tell which station I am listening to on the walkman. And last night, I bravely tuned to GLR 94.9FM at around 8.45pm. Everything went well for the first half hour or so. The DJ (today GLR told me it was David Hepworth) had a "rock star spelling competition" (how do you spell Shakespear's Sister?), no trouble there. I was recording the show onto tape just in case anything unpleasant happened, as I had reason to think it might.

Around 9.10pm, it did. Here, precisely, is what Hepworth said after the song "Come Around" by the Muttonbirds (I have this on tape, and at some point will be posting the audio on my website);

"New album's called 'Envy of Angels', that comes out soon, that's the single that's already out, I would imagine, that's 'Come Around', the Muttonbirds, er, coming up after this, we got the rock-and-roll A-level, we have, I assume, Brian do we have an embarrassment of prizes in there, we do, don't we, (EMPHASIS) absolute obscene (END-EMPHASIS) amounts of prizes, there will no doubt be a riot at the back door", and that's, er, A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasized verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasized) described the disgusting sexual abuse which the harassers have been throwing at me.

Needless to say, I can't prove this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. But I shall be sending him a copy of this explanation. We'll see what he has to say for himself.

I will try to explain with greater clarity.

I am prone to have ideas of "interactive watching" by people on TV, and "interactive listening" by people on the radio; which means as I listen to their programme, they are aware that I am listening (because my home is spied on, and those doing the spying phone up the radio station and tell them that I am listening to them), and they then interject nasty remarks in what they say. This is what I believe may have happened on Friday night with GLR, and what I was trying to explain in my article.

It's happened before with other radio stations, most worryingly when I am listening quietly on my walkman as happened on Friday. This time, the interjected words were "embarrassment" and "absolute obscene". The "absolute obscene" referred to the abuse which is currently being directed at me.

I hope that's a little clearer.

Subject: "Scandalous, Frivolous or Vexatious"
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

A couple of weeks ago I issued a summons against the BBC in my local county court, for the tort of private nuisance caused by the spying by their newsreaders on my home. My argument was that their spying had prevented me watching the news at home, and therefore interfered with my normal use of my home.

The BBC's Litigation Dept at White City have replied not with a defence, but with an application for my claim to be struck out because;

(a) it discloses no reasonable cause of action; and/or
(b) it is scandalous, frivolous or vexatious.

Their application will be heard next week. They have not made any affidavit in support of their application, nor have they given particulars as to why they consider my summons to be unarguable in law, which would be a necessary condition for there to be no reasonable cause of action.

I am more worried about point (b). Allegations are scandalous (says Stuart Sime's book) if they impute dishonesty against another party; which my allegations do, against the BBC's newsreaders. As for frivolous or vexatious, I think that will be up to me to make a good argument for the effect the BBC's spying has had on my life, and up to the district judge's opinion of my case.

Apparently seeking to have a claim struck out in this way is common practice when the plaintiff is a litigant-in-person. Even if it is struck out, there is always the opportunity to appeal. I think we could be in for a fight next week.

Erm, explain this rather dubious statement.

>As for you. Don't you think it's a trifle condescending to refer
>to people as mad. I know they are homeless and without internet
>access, but maybe they are just eccentric.

Congratulations. This is my first real flame for about a year.

I try to control my anger when I come across another uninformed naive idiot on usenet, but sometimes it goes free. We've had Corley for well over three years now, and his constant spams of various degrees have killed a couple of usenet groups I really rather lied. uk.media, to name but one. I gets my goat to read another useless fucker thinking he is a harmless eccentric.

Mike is mentally ill. He is unwilling to deal with it. He seems to think that uk.misc is some sort of forum that MI5 reads. And it should be avenged. He's mailbombed a large quantity of people, because they opposed his spamming.

1. He thinks MI5 watches him through his television
2. He thinks all references to mad people, refer to him
3. He thinks all people shouting, are shouting at him.

4. He's been diagnosed as mentally ill, just not a paranoid schizophrenic.
5. He gives not a shit about any newsgroups he abuses.
6. He goes through quiet periods, then _very_ nasty periods.
7. All evidence of this great conspiracy is laughable, to say the least.
8. He gives internet/usenet a bad name to the media. Including mailbombing Chris Tarrant and faxing various celebrities.

I do not condescend to him. I actually know what he does, and has done in the past, and am frankly not too respectful of him. He can be openly referred to as "mad" because he is. Let's check my mailbox saves:

Repost of when I thought I'd seen the last of loopy mike:

>>J.J.Smith@ftel.co.uk (John J Smith) wrote:

>particular avenue of exploration is at a dead end.
>
>WTGROMT (well that's got rid of me then!)

Have you actually visited his web page, and read the massive conspiracy that is supposed to be against him? Apparently MI5 watch him, but for no reason. They do it for a laugh. Because they can. It costs them a lot of money, but they still do it. Reality is but a memory for this man.

He hadn't seen the light at all. His level of spamming had got to such outrageous proportions that we had to mount a concerted

attempt to get his account(s) closed. The reason for the lack of spam lately is that Mike has been furiously swotting up on Law so he can bring an action as a LIP against the BBC (all solicitors having quite rightly and honourably declined to act for him). When this course of action is exhausted without result, I confidently predict that we will once again be the innocent victims of his ire and the spamming will commence again.

Subject: I am being ignored
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

Something mildly unusual is happening. Nobody has been getting at me for the last couple of weeks. Best of all, about three weeks ago I bought a video recorder to try to get some evidence from the News etc, and despite having watched Martyn Lewis, Michael Buerk and the whole lot of them, not one of them has said anything to me in the last three weeks. And I have been listening to and recording Capital, with no ill effect. All in all, I am being comprehensively ignored.

Of course, I should have video-taped the news programmes back in 1990/91/92 (and even 93) when it was still all going on. Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent a person I am, yet I didn't have the good sense to record the programmes at the time, and it's a bit late now.

Today another avenue of exploration closed when my second summons against the BBC was struck out (basically through lack of evidence), and an order was made by the district judge saying that I could not sue John Birt again without the express permission of the court. She explained that this was for my own good, to save me the summons fees. Costs were not awarded though (the BBC didn't even really seek costs), and I am free to sue anyone else I take a shine to.

....

It is not that you are being ignored.... it is just that as your mental health improves, so your paranoia eases.

OR...

The dark forces are gathering strength for the final battle with you...

Seriously though, it's nice to see you back - cos as long as they are persecuting you, I can relax knowing they haven't got time to bother me!

Mike Corley (bu765@torfree.net) wrote:

[unreasonable optimism snipped]

Well, that didn't last very long, did it?

Capital Radio this evening approx 8.35pm, Neil Long's programme a few moments after I switched to it (I am listening to it as I type this). The following spouted from his mouth;

"want to see Jacko in town? what a gig it's going to be, that guy is amazing, and PSYCHOTIC, but amazing on stage, 0171-4200958, on stage he's a MADMAN but he's wonderful"

God, I am so tired of this. It's been going on for seven years. When's it going to stop?

I have the above extract on tape. When I get around to it I will post it, and the Hepworth snippet, as audio files on the website. Of course, all the doubting Thomases and Smids can carry on doubting, because the mere fact that moments after switching on the DJ starts talking about "psychotic", that's not proof is it?

I wrote an aggrieved letter to Chris Tarrant at Capital and sent it off today, copied to Richard Park, Group Director of Programmes. I suppose they'll just lie as usual. Bastards, basically.
....
The solution is surely to not have a TV, video, radio or telephone in the house, Mike. That way they can't be used to watch you.

No. I tried that strategy in 1990/91 when I sold my television and stopped listening to the radio. It didn't work because they got at me through co-workers and eventually the general public.

The solution is to gather evidence by recording everything, and then complain or sue if possible. I wish I'd recorded it all five or six years ago, then I might be more successful in a legal action now.
....
Did anyone else watch the X-Files on Sky last night (Sunday 13th April) and

recognise Mike's symptons in the chap with the tattoo? It was quite interesting to see someone responding in precisely the same way, picking up on individual words and phrases in ordinary sentences and applying parts to themselves as though they were intended.

Not a pleasant ending though. You take care, Mike, and keep taking the medication. uk.misc just wouldn't be the same without you now.

No, it isn't, but you knew that anyway.

Mike, how is it that you think that this can't be a coincidence because it happened 'moments' after you switched on the radio? Haven't you just told us that you haven't heard a thing for two weeks? Going two weeks watching TV & listening to the radio without a reference to 'mad', 'crazy' or 'loony' is quite an acheivement, especially given the trashy radio you seem to prefer.

I've just spent a lot of the weekend trying to keep a manic depressive under control, so that she doesn't have to go back into hospital and lose the last few months' memories to ECT. One thing I've noticed is that manic depressives almost seek to foster their fantasies, they enjoy the control and the high. You seem to be the same - you refuse to answer the points put to you that explain away what you call persecution totally - do you have the courage of your convictions to reply to this? Or do you enjoy the attention your illness brings you?

Do please tell the *truth*. It has been longer than *2* weeks as I'm sure you have noticed, hasn't it ?

Well I claim responsibility for the absence of persecution. When I rang John Major's personal private secretary, not the personal political one or any of the others in the same office, and I said you would vote for the

Conservative Party at the General Election the secretary said Johnny would be so happy and as a sign of gratitude he rang-up the Head of MI5 and told them to save money for tax cuts by abandoning forthwith their campaign against you. Consequently MI5 and MI6 have been able to redeploy urgently needed resources (i.e. manpower and telecoms interceptions) against an international band of (*****censored*****).

On behalf of the law-abiding and decent citizens in the British islands, I would like to sincerely thank you for your invaluable contribution to crime fighting by your instrumental achievement in releasing badly needed and very scarce MI5 and MI6 resources.

Many thanks,

> Best of all, about three weeks ago I bought a video recorder to try to get some evidence from the News etc, and despite having watched Martyn Lewis, Michael Buerk and the whole lot of them, not one of them has said anything to me in the last three weeks. Please don't forget it is National Election time and the news broadcasts at 21:00 on BBC1 are preoccupied with British politics.

> Of course, I should have video-taped the news programmes back in 1990/91/92 (and even 93) when it was still all going on.

Any particular date in mind ? I have a few in the library. You can also purchase copies from the BBC on 0181-743 8000 (central switchboard).

> Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent a person I am, yet I didn't have the good sense to record the programmes at the time, and it's a bit late now.

Perhaps it is for the best. Now that it is all over, you can return to Canada. Did you manage to get your Canadian citizenship ?   What did your contracts at MI5 say about you becoming Canadian ?   You never did mention the name of your MI5 liaison officer nor of any of the others.

> Today another avenue of exploration closed when my second summons against the BBC was struck out (basically through lack of evidence), and an order was made by the district judge saying that I could not sue John Birt again without the express permission of the court. That's true. But as it is now all over there is no need to worry about the past. MI5 said your file has been removed from the Registry and put in a burn-bag so there is nothing left for anyone ever to find.

By the way, what was the URL of your famous Corley web site ?

I have to admit that it is actually mildly amusing to have newsreaders watching you, although it is tiresome after a bit. I am currently in an interesting situation, because after my lawsuits against them I think the BBC newscasters have stopped watching me entirely; I also think that ITN, in particular John Suchet, *are* still watching but they're being subtle about it (his blink pattern followed mine).

Being called nasty words is quite horrible though, and seems gratuitous; what do they gain by it, except to exercise their sadism?

You have. They're not pleasant atmospheres, especially the secure wings, which have more in common with prisons ('airlock' doors, list of 'banned' articles, continuous observation). They have to be that way, unfortunately.

The WJ M14 is marked L for LO and has spec of 4-9 GHZ, RF for RF spec is
4-8 GHz, and I for IF spec is DC-2GHz. Isolation between ports is 30db
typical, loss is 5-6 db, and noise figure is 5-7 db. Is that enough info?

For applications sensitive to phase noise, the built in PLL's are not
a help but a pretty severe hindrance. 27 dB of hindrance in particular
for the chips I'm familiar with (AD9954 family) for phase noise 1kHz
out.

That doesn't mean that the DDS's (using refclock PLL or not) aren't
still damn useful for all sorts of stuff!

Tim.

You better believe it. Tuesday's episode had one of its characters being labelled as a "lunatic" with "something wrong with them". I changed channels rapidly at this point, but in retrospect perhaps I should have carried on watching and taped the program.

A few days ago I bought a video recorder (about time too) for evidence gathering purposes. But strangely the TV news (both BBC and ITN) haven't uttered a sound over the last few days. Almost as if they know they're being taped...

>You better believe it. Tuesday's episode had one of its characters being
>labelled as a "lunatic" with "something wrong with them".

And?

There are many characters in TV programmes who _are_ lunatics with 'something wrong with them'. Why do you think this alludes to you?

In the eponymous book, Cervantes' Don Quixote is described as 'crazy' 'mad' and 'lunatic'. Do you think this is a reference to yourself, albeit written by a time-travelling 17th century Spaniard?

If you accept that the character of Don Quixote can be described thus without it being a reference to you, what problem do you have with Peak Practice? Or do you enjoy tilting at your own little windmills?

A friend's lodger has turned out to be paranoid schizophrenic. Her obsessions are strikingly similar to yours, she is convinced that she is being bugged, and that students at her college are making fun of her for being foreign. She has been looking for the services of a private detective. Maybe Oxford has this unfortunate effect on foreigners?

I must say that I'm surviving rather well, or that's what the man under the stairs told me yesterday.

Subject: The Continuing Silence
Newsgroups: uk.misc
Organization: Toronto Free-Net
Summary:
Keywords:

The silence continues. I am enjoying listening to Radio 4 without any ill effects whatsoever. Admittedly I am recording every moment, but still. Even better, I have fished out a recording from ITN last year which at the time I was convinced had been about me, and on re-seeing it I am now convinced it is not about me at all.

But that is not to disclaim all the many "live incidents" that have happened. Everything written on my website is true. For the newcomers, its URL (as seen in the Observer and Private Eye) is

[snip]

```

Victor Lewis-Smith has broken the silence in his TV review column "Goon and best forgotten" in the Evening Standard (on Thursday 8/May). He said, "If I sound paranoid, that's probably because I once worked there. Eventually, I had to leave because they were all trying to kill me but, for sheer pathological hatred of the Corporation, I couldn't hold a candle to Spike Milligan".

I take this to be about me, because recently I wrote to both the BBC and Capital Radio, saying "I believe the current purpose of the harassment is to force me to kill myself to prevent the harassers, yourselves included, from being brought to justice, and last year there were several incidents of people shouting 'suicide' at me, which would appear to corroborate that view." I think VLS's words about the BBC "all trying to kill me" shows he has seen or heard of what I sent to the BBC or Capital.

Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he would explain his article?

....

Erm, Mike, I'm a bit of a fan of Victor Lewis-Smith, ever since his days of "BuyGones". I must admit, he often likes to play the flawed lunatic evil nasty person. He's been doing it for years, with prank calls, far before your illness. Its his act. He wouldn't be VLS without it.

He doesn't like the "Goons" either. It isn't about you.

>I take this to be about me, because recently I wrote to both the BBC and

I don't think Victor Lewis-Smith has worked for the BBC (or Capital) for several years (1994 was the last time...), so the connection, is paranoia here.

Personally, I believe VLS as a person of reasonable integrity, who wouldn't give a fuck about you...

>Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he

Subject: David Hepworth (GLR) is taking the piss
Newsgroups: uk.misc
Organization: Toronto Free-Net
Summary:
Keywords:

>Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that
>I was listening by stealth. Back in 1990 I used to have Capital blaring out of

Not much changes. Today I was listening again to David Hepworth's show on GLR, having more or less waded in on it by accident. Here is the exchange;

David: "we have executive drivetime, we have Brian in charge of the prize cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know if you remember him obviously still alive and kicking...."

David: "Rock and roll spelling test is your first opportunity to take advantage of this embarrassment of prizes"

What do I read into this exchange? The laughter after the word "embarrassment" shows they're aware of the last complaint I made on usenet (copied by snail-mail to them). The "left hand" business is I think a coded way of calling me a w***er (the term would be better applied to Brian and David).

I have a tape of this exchange, and will eventually get around to posting it on the website.

I don't understand. Why has nobody replied to this post? You keep on asking for evidence, then I present you with something that looks very much like evidence, and everybody just ignores it. OK I haven't posted the actual sound extract, and it still isn't proof.

Perhaps everybody just finds it all too boring and dull. Should I start spamming again from one of those nice anonymous remailers to wake everyone up? Now there's a thought.

....

Mike Corley <bu765@torfree.net> wrote:

Cos you don't reply to our points - you're ignoring us, why shouldn't we ignore you?

>You keep on asking for evidence, then I present you with something
>that looks very much like evidence,

No you don't, you post something which could _never_, _ever_ be construed as referring to yourself. Can't you see it? No, of course you can't, you've an illness.

>Perhaps everybody just finds it all too boring and dull. Should I start
>spamming again from one of those nice anonymous remailers to wake everyone up?
>Now there's a thought.

And I see you've started. Give it a rest, Mike, unless you're prepared to enter into proper discussion.

Phil-

I'd say you would be better off with a portable generator riding along to provide power to a 120 or 240 VAC amplifier. This would be easy if you had a mobile home, since it may have the generator already.

For 1000 Watts DC, you would draw 71 Amps. Throw in an efficiency factor and you might be up to 100 Amps. By going with the AC generator, your current is more manageable with around 12 Amps at 120 VAC or 6 Amps at 240 VAC.

Check out the Honda EU2000i generator, which is capable of supplying a continuous 1600 watts at 120 VAC. It would be neat if you could mount it outside and feed it from your vehicle gas tank. (It is also a very quiet generator.)

Overview

What all these snatches of video and audio, and newspaper articles, have in common is that none of them provide conclusive or very convincing evidence of their being directed against me, or forming part of a campaign against me. Other people with my illness doubtless could produce similar non-proof if they were minded to do so.

Good, now we've got the disclaimer out of the way, we can describe precisely what it is that is on display in this part of the site. In the video section, we have Quicktime (MPEG-4) clips of Jon Snow of ITN in action, also interviews with Ken Clarke and John Major of the ousted Tory regime. These are embedded in the page using QuickTime. While each audio/video clip is coded to automatically download the QuickTime player, you may find it helpful to download QuickTime from Apple's website before you start viewing the media files.

Note that each item is awarded a rating of the confidence I feel that it is directed at me, expressed as a percentage. Items with 50% or more are probably about me; 100% indicates a "dead cert".

In audio we have MP3 files of harassment at work in Canada in late 1996, also GLR's David Hepworth not even trying to pretend that he isn't getting at me, and a snippet of Capital. There is also an album track which I have taken as being about me. The newspapers section contains articles by Bernard Levin on his encounter with a madman who "bursts into tears, and swears it is all true - and it is". Also a Private Eye cover, and snippet from Victor Lewis-Smith.

I have added several recordings of abuse "in public". By Sept/1998 I had seven minidiscs of such recordings, unfortunately containing mostly very nasty sexual slanders which I will not be publishing on this website. The recordings were made on a Sony Minidisc Walkman MZ-R30, which I purchased in Canada in July/1997, with ECM-T140 microphone. After both the MZ-R30 and the microphone reached the end of their lives, in June/2001 I purchased as replacement my current recording gear, an MZ-R900 walkman with ECM-T145 microphone.

Share and Enjoy! I hope you enjoy partaking in my delusions which have been recorded with high fidelity digital equipment and presented for your listening pleasure.

Hi Ken,

Tim did comment properly to your PLL question.

User has to decide what he needs and if his application will be OK with the internal PLL multiplier or need an external low noise clock.

If one live in a place where the roads are not good he hs to compromise ... probably it is not good he buys a Ferrari but could be OK with a Corvette...maybe red...

If you have a high performance RX front-end probably it is better to use an AD9912 and an external Low noise oscillatorgiving at least 1Ghz clean signal for low phase noise and low spurs. If you have a SoftRock SDR I am sure you will be OK with an AD9851 using the internal PLL like it is done in the DDS-60.

Hi Fred,

I hear what you say but I really don't wish to tow anything let alone a genny.

I've experience with high output charging systems and split charging circuitry and have no problems supplying a 'stiff' 14v at a few hundred amps.

About the only good thing about running QRO on sideband is that the 'average' current drain is really not that high, even with say 50% efficiency out of the amp. Peak current is pretty high but a couple of decent quality batteries with a good charging system see that as no real pain.

2 X 0 or 4 X 0 welding cable is the order of the day for minimal voltage drop and a Leece or Electrodyne alternator.

Anyhow, let's see what others have to say.

Thanks again.

Phil G4ZOW

Ken Clarke (1), April 1997

Certainty level: 30%

The first of two video segments from the same program, this shows Jon Snow interviewing Ken Clarke in April 1997, during the general election campaign. The following exchange is heard;

Jon Snow: "You say we are booming in your posters, the bust's around the corner"

Ken Clarke: "You took that from three years ago, when I was being advised to do all kinds of mad things to stimulate the economy, and being told that I had to take desperate measures to get it going"

At this time I was watching television almost continuously at home, with a video recorder whirring away, trying to obtain from the newscasters a reaction which would give them away. I think this is an instance where it happened. Ken Clarke first darts a glance straight at the video camera (and perhaps at a monitor next to it showing my living room), then comes out with "all kinds of mad things", while engaging in a facial display involving raising of eyebrows and lowering of eyelids. To me at the time, and also now, it looked as if he was selecting a context into which he could drop the word "mad" as a directed insult against me.

Ken Clarke (2), April 1997

Certainty level: 30%

The second of two video segments from the same programme, this shows Ken Clarke during the election campaign. He makes the following statement;

"we have a party, and we have a Cabinet which has produced a manifesto
consistent with our policy of the last five years;
people are challenging us on the basis there's been some monstrous
conspiracy between all the politicians to guide us we know not where,
we know where we're going, we wish to be a leading influence in the European
Union"

It should be fairly obvious what I read into in the above sentences. The "monstrous conspiracy between all the politicians" could of course apply to the public perception of closer European integration, but I took it as referring to the conspiracy of politicians and media people against me. Again, facial expression comes into it; as Clarke speaks of the "monstrous conspiracy" his eyebrows twitch and it is clear that something or somebody is being made fun of.

Dimbleby / John Major, April 1997

Certainty level: 90%

Dimbleby interviews John Major during the election campaign. Here is the exchange, regarding Neil Hamilton, the "sleazy" Tory candidate;

Dimbleby: "It's a direct quotation from what he said to Sir Gordon Downey and what he said to his local newspaper, the Knutsford Guardian".
Major: "Well, heaven forfend that I should doubt what the Knutsford Guardian actually said"
Dimbleby: "Well I should hope so"
Major: "Absolutely, it would be quite unforgivable to doubt the Knutsford Guardian"

What I find in this segment is an assonance between "Knutsford" and "Nut" or "Nuts". I think Dimbleby deliberately invents the play on words, and says it clearly enough for Major to pick it up and repeat it. You can gauge Dimbleby's intent from his facial expression of false honesty when he uses the words "Knutsford Guardian"; and Major's reaction follows from his recognition of Dimbleby's intent; Major smiles and says it would be "unforgivable to doubt the Knutsford Guardian". These are much clearer on the original video than on this Quicktime clip.

Channel Four TV News - 12/Feb/1999

Certainty level: 100%

I am positively, utterly, completely sure this item is about me. It's a bit subtle so the objective reader might not understand my certainty. Here is what happened. I was watching Channel Four News with Jon Snow, on the day Clinton "got off" (as it were) in the Monica-gate scandal. Snow said;

"[and we're anticipating that the President himself will make his] first comments after the trial in which he has now been cleared at around half-past seven. So we'll have more on the historic judgment, we'll also be considering [starts smiling] the winners and losers in this whole sorry saga. Now further doubts have been...."

When Snow said "half-past seven", I looked at the clock on the mantelpiece above the TV. Snow saw my glance, and in reaction to my glance at the clock, smiled. I think he was smiling at what he perceived as my self-importance.

Usually when newscasters or radio presenters laugh at me, there is an excuse for their laughter; usually they manage to find some reason for my being "funny"; their amusement is blamed on me; it is my "fault" they are laughing. And so it was with this instance; Jon Snow thought it was funny that I should be so interested in seeing Clinton, and his half-smile while reading the words "winners and losers" expresses that.

I wrote to Snow at ITN shortly after this broadcast to ask him about his behaviour; of course, he didn't reply.

Fill the trunk with batteries, run two 100 amp alternators in parallel, solid state batteries switch for the batteries and buy plenty of 0 or 00 stranded wire and expect for a lot more people to hear you then you can hear ... blah, blah, blah.

Regards,
JS

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed at me when he said this. During his "Who wants to be a Millionaire" TV show in

March 1999, he said;

if you're watching the show jumping up and down screaming at the telly, remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help" were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

Hi Scott. what I would like to do is use the original radio and
replace all the tubes with solid state. I have built a few stations
over the years so it can't be that hard.

John

Hello All,
I was told by a ham during a QSO that if I buy a matched pair of 6146b's, I
would not need to neutralize them?? Is that true?

Thanks KB3IBT

John,
it is alot more fun to restore an old tube radio.
I did it many times. Parts are available.

Matched pair implies the tubes will be drawing equal current for a given
grid bias; there is no way to "balance" the tubes in most rigs.

Neutralization is used to cancel unwanted capacitive coupling between
the internal tube elements, which varies by manufacturer and tolerances.

Usually you don't need a "matched pair"; I'd go with new tubes of the
same manufacturer and relatively close production dates. In other
words, don't mix a used RCA 6146A with a new imported 6146B
and expect the tubes to last.

Oh, wow, thanks for the explanation Uncle Peter. I really appreciate it! I'm gonna stick with new tubes. I hope my TS-530 will be able to tune up. Its been sitting almost a year collectin dust next to my beloved TS-870.
I tried tuning the 530 this past Sunday and it wouldn't budge. Nothing at all. It still receives pretty good.

Again, Thanks!

I am designing a broadband radio with all decoders implemented in software. So far I have developed AM, FM, SSB, CW and DRM (digital radio) software methods for reception. I would also like to include iBiquity digital for the AM and FM bands. My guess is that IBOC is a variation of OFDM transmission, but so far the details seem deliberately evasive. Any one with more details?

I think that IBOC is headed for oblivion. Would like to see how it performs before it dies. There are no commercial radios that I would want to buy for HD radio, they all seem like a mind-numbing waste of money. My only interest is a home brew software version integrated into a multimode receiver.

Seems to be proprietary technology. Imagine that! The US government

literally giving away public airwaves; that means they will have
licensing fees for the transmitting equipment, and any receiver made
that will work will IBOC. Wonder where this leaves the
experimenter?

It's not so obvious that a transmitter that doesn't "budge" obviously needs new finals. If the last time the transmitter was used there was a big puff of smoke from the final compartment and a lot of blue flashing, maybe, but I've smoked far more plate chokes and HV coupling or bypass caps than finals over the years.

Does it show any plate current at all? The finals are biased for AB1 or so and probably should draw 50 mA or so (see your manual for details) when keyed up and no signal. If so, as you tweak the bias (not sure where it is in a TS-530 but there must be a final bias pot) does the current behave semi-linearly?

If you have bias which behaves right but no signal out, I'd suspect something in the drivers, not the finals.

If you're sucking major current when there's no signal, then the tubes might be gassy or maybe the screen current is out of whack or you've got some super-nasty parasitics (which actually comes back to the neutralization you asked about).

If the bias isn't behaving right, I'd suspect plate choke/bias circuitry/screen supply/plate supply.

If it sucks current but fails to load up, then a bad coupling capacitor or bad bandswitch or pi-network variables.

Tim.

I gave you a lot of places to look in my other post, but suddenly the
"Nothing at all" rings a very clear bell. Replace the driver, a
12BY7A, first before suspecting the finals, and especially if the bias
current in the finals is doing the right thing.

Tim.

May be worth checking the SG switch, I've had a few in for repair that
had it switched off.

Hi,

can you check the HV reading from teh front meter,
s/b 850-900v if half that electrolytic cap(s) need replacement.
digikey has modern caps that fit nice, info in the yahoo forum below.

you may not have a tube problem, could be something else,
as posted, more info is needed to help figure it out.

also, is screen grid switch turned on (black switch at rear of radio).
it is easy to slide it off if radio is moved and no output if it is off.

avoid the imported tubes, others have had instant tube failures using
made in china tubes and this also takes out cathode resistors.
rf parts and www.surplusales.com have us made tubes,
surplussales has tube specials along with the driver tube.

join other ts-5xx/8xx fans here,

http://groups.yahoo.com/group/TS-520_820_530_830/

lot of info in file section, messages are public access.
tube neutralization info in the public and file sections.

these radios don't like to sit unused, most of the time they need
a cleaning of the band switches and you are on the air again.

could be driver tube, always change it first (save the old driver
for use in another radio) before the finals.

If the TS530 is like the 520, one sign that the PA stage may need
neutralizing is that when, during tune-up, the maximum power output does
not coincide with the plate current dip. Another side-effect may be that
the receive pre-selector peak does not coincide with the transmit RF
drive peak.

If all seems more-or-less OK with the new tubes, you can probably leave
things alone.

However, if your 530 doesn't tune up at all, you'll need to look for
more than neutralizing (as suggested by Tim).

Hey Guys,
Thanks for all the suggestions.
Well, the SG switch is in off position. Just like the manual says, I'm
drawing 60ma when the meter is on the LP position. But I still can't get a
drive, plate, or load reading on the meter when I ry to tune it up.
One thing I didnt consider is the driver tube?? I thought that was for
receiving only! (LOL) I think when I get this figured out I will appreciate
tube technology alittle more.
I cant waite to check out the TX-XXX groups.
Again, Thanks

If you have the quiescent 60 mA idling current, it has to be something
else besides the finals. There's no drive, you'd see the plate current
go up when peaking the preselector.
A dirty switch contact, etc. Something simple I'd suspect. I doubt the
driver tube went bad sitting... Also, it is probably more "touchy"
to replace than the finals; I've seen big differences between American
and imported 12BY7 tubes! (I assume that is what they use, IIRC.)

Is it possible for a VSWR meter to read 1 to 1 with reactance at the
antenna?
Ex. If the antenna Z was R= 30 and X= 40 would the meter read 1 to 1?
Or is there a combination of R and X that would give 1 to 1?
                                      Thanks for your answer and
explanations,

The SWR at the source is lower than the SWR at the antenna due to losses in the transmission line. 200 feet of RG-58 used on 440 MHz will indicate an SWR very close to 1:1 at the source no matter how reactive the load at the antenna. On a normalized Smith Chart, the SWR "circle" is really a spiral with an end limit of Z = 1.0 + j0 in the center of the chart.

There are technical "white papers" on the Ibiquity website, but I don't think they provide enough details to implement a decoder. As other replies have indicated, they consider this proprietary. (I wonder if there are enough details in the patents?) I suspect you're going to find the only way to implement a homebrew IBOC receiver is to acquire an evaluation chipset.

The White Papers confirm that OFDM is used. If I read it properly (and I may well not) the FM scheme uses 180 subcarriers and the AM 108. (in both cases in Hybrid Mode where the analog is still present. Both AM and FM support a full-digital mode with more subcarriers.)

Have you tried tuning up the transmitter as per the instructions in
the owners manual? - first and most obvious thing to do. THEN perhaps
a estimate of fault finding procedure can be worked out......

Until then, guesswork.

Also, the owners manual has a nice section on theory theory of
operation of your radio - it might be helpful if you read it and thus
have a common ground for your queries to the group.

Andrew VK3BFA.

Mike

The VSWR meter is showing power reflected back down the line to the meter. If the line is very lossy, like a long length of coax that has been penetrated by water, the reading may well show 1:1 but the radiated power will be zero. On its own, the VSWR meter provides a very useful indication that the antenna system is matched to the output of the transmitter. It is not a guarantee that the system is actually radiating a signal. A simple field strength meter will give an indication that the power supplied via the feeder to the antenna is actually being radiated rather than absorbed.

Cheap VSWR meters can be quite inaccurate when presented with loads which differ from their design impedence. Used with an understanding of their limitations, they are fine for everyday ham use, but something a bit more sophisticated is needed for serious antenna system measurements.

Mike G0ULI

amdx wrote:

> Is it possible for a VSWR meter to read 1 to 1 with reactance at the
> antenna?...

The vswr is determined by the absolute value of the reflection coefficient, being defined by:

$$\text{vswr} = \frac{1 + |ro|}{1 - |ro|}$$

where the greek letter "ro" indicates the complex reflection coefficient

$$ro = \frac{Z - Zo}{Z + Zo} .$$

So the one and only case in which we can have unity value for vswr is when |ro| = 0, or perfect match. In a * lossless * transmission line, the vswr is the same in every point of the line (this is an easily demonstrable general result, it comes right down from the above expression), so (with normal lines) the answer is definitely no :)

Of course, as correctly pointed out by Cecil, in a lossy line the reflection coefficient decreases as you move along the line away from the termination, and the same happens to the vswr, so that a long lossy line may simulate a good matching also when the matching isn't even near to good (btw, using a lossy coax is an often used trick (especially in microwaves), when you need to give to the generator a seemingly good load).

As others have pointed out, unless the line is lossy, the answer is
no.

Here is a way to calculate SWR from R and X without the complex
arithmetic. It is taken from 'Reflections: transmission lines and
antennas' by Walt Maxwell, 1st ed, page 23-5, or 2nd ed page 'appendix
3-1'.

Let r = R / line impedance
Let x = X / line impedance

b = (1 + r*r + x*x) / r

SWR = (b + SQRT(b*b - 4)) / 2

The minimum value of b is 2 when r = 1 and x = 0

The minimum value of SWR is 1 when b = 2

Hence it can be readily seen that any reactance will cause the the SWR to be greater than 1 at the load..

Just to complete the maths,the modulus of the relection coefficient,
ie mod(p),
= SQRT((b-2) / (b+2))

HTH and 73

Contrary to what I see in other postings, yes, sure it could. This is very easy to see on the Smith chart. Consider that the meter is calibrated to 50+j0 ohms (which, by the way, it's not guaranteed to be "out of the box" when you first get it!). Consider that connecting the 30+j40 ohm load to the meter are two sections of lossless line. The section connected to the load is 42.1 electrical degrees of 45 ohm line, and the section from there to the SWR meter is 87.7 degrees of 82.5 ohm line. That gives you 50.03-j.01 ohms presented to the meter. Note that 45 ohms is within 10% tolerance of 50 ohms, and 87.7 is a poorly-made 75 ohm line that's out of tolerance. Hey, copper has gotten expensive, and the manufacturer is scrimping to save a few bucks.

Likely the meter is NOT calibrated to 50 ohms, and that would allow a different set of line impedances to achieve a match. With some loads, you only need a single section of line the right length. For example, if you said your meter was calibrated to 50 ohms, and the load was 67+j28 ohms, you'd get a 1:1 SWR reading with 42.6 degrees of 75 ohm line. Note that the actual SWR on that line is NOT 1:1. SWR meters tell you the line SWR only if they are calibrated to the line impedance. Reg Edwards always used to rail against calling them SWR meters, but to me, the name is fine if you understand the need for calibration, the need to apply them properly.

Cheers,
Tom

If it's a commercial rig, and it is, the questin belongs elsewhere.

Perhaps rec.radio.amateur.equipment if it's a ham rig. Elsewhere if not.

There seems to be an increasingly sloppiness about newsgroups, with way too many people not bothering to find the most relevant one, so they either cross-post or just post wherever they feel like it.

The reason the question arises.
I've build a 2.4Ghz Patch antenna. It has gain. I move the feedpoint to

change the
input impedance. Now it has more signal strength, so I move in the same
direction again
and it shows even more signal strength, 2 more adjustments more signal, 1
more move
and signal strength looks like it's starting to go down in signal strength.
(These moves were about .060" each.)
Now I see a VSWR meter at http://pe2er.nl/wifiswr/
I wonder if this can help me get a handle on adjusting for proper impedance?
The reason I want 50 ohms is because I want to build an array of 4 Patches.
The 50 ohms is important to impedance matching with 1/4 wavelength coax.
I'm using this site as info for the matching and connections.
http://www.darc.de/distrikte/g/T_ATV/Hybrid-Double-Quad-Array-GB.pdf
Yes, I'm using Patches instead of Biquads.

Thanks, Mike

PS. What do you think about the antenna spacing?

So now the problem I don't know what the input impedance is.

Perhaps the OP could have been more verbose, but I interpret
his query in the context of a potential homebrew project utilizing
the rig as a basis, ergo the query is on topic...

Regards,

Michael

Hi Mike,

Looks like you found away to get a low SWR (does it really matter how
much it is if you can't improve the output?).

>(These moves were about .060" each.)
>  Now I see a VSWR meter at   http://pe2er.nl/wifiswr/

You've got the plans for a good SWR meter, let it go at that.  You
could probably build it faster than waiting for the final benediction
here.

Oh, there's always a but,
I cut the foil to the antenna in a wifi adapter and soldered a 2" piece of
coax to the
foil and ground, my Patch is at the other end. The wifi adapter is a dongle
mounted
at the antenna. See Picture at;
http://www.tp-link.com/products/product_des.asp?id=47
Now the question is: Is the wifi adapter output really 50 ohms? If it's
not 50 ohms
then I need not attempt impedance matching with 1/4 Lambda length coax.
I searched for several hours looking for specs on the RF chip in the wifi
adapter

without any success.

 I don't mind waiting, I don't have any parts for the VSWR meter.
(I was looking for confirmation that it would be useful.)
  Regarding the spacing; The literature I've seen shows spacing of
0.2, 0.3 or 0.4 Lambda before grating lobes form. But the Patch is 0.5
Lambda wide so you can't get them closer than 0.5 Lambda.
Here's one source;
http://www.orbanmicrowave.com/The_Basics_of_Antenna_Arrays.pdf
 At this point I have a working Patch with good signal strength, so now I'm
just trying to see if I can improve on it, The project has got complicated because
the only measurement tool I have is the software signal strength meter that came
with the wifi adapter card.
Thanks for your input,
Mike

Hi Mike,

There are very, very, very few antenna designs that arrive out of the box with 50 Ohms Z. You usually have to manipulate something (feed point or linear loading, or coupling between elements or other radiators) to get it.

The good thing about microwaves is that you can build and test so quickly - and throw away what doesn't work. This isn't like you are making jewelry after all.

The scale of construction is one you can get your arms around at the
kitchen table. If someone reliable built one and documented it enough
(both of these provisos are, admittedly, built on a LOT of trust);
then you don't need any instrumentation at all.

>I searched for several hours looking for specs on the RF chip in the wifi
>adapter without any success.

It sometimes takes some deep digging.

> Regarding the spacing; The literature I've seen shows spacing of

>Here's one source;
>http://www.orbanmicrowave.com/The_Basics_of_Antenna_Arrays.pdf

Pretty tedious stuff, that. EZNEC can do it all in real time - even
the free version is sufficient for your purposes. For one, don't
confuse matching with the radiation lobes - those issues are separable
and you can ignore matching to examine lobes.

> At this point I have a working Patch with good signal strength, so now I'm
>just trying to see if I can improve on it,

Give yourself the benefit of the doubt and just move forward - the
rest is analysis paralysis.

Possibly, but it is immaterial. It is probably meant to drive rated power
into a 50 Ohm load.

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 19th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall

Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **

$15 per person at the gate.

I was wondering if anyone found any more info on the chip (HY1417LP) I
too purchased the mp3 fm transmitter, but unlike what I have read I am
looking for which pin on the 16 pin chip is the antenna? my eyes are
not what they use to be and even using a loupe its hard to read the
curcuit board. What I would like to do is extend the antenna or maybe
built a fm booster to extend the range lets say @ 50 feet from my car
so I can listen while working outside, at the beach, etc.......

I have been searching for a QST article that detailed modifying a TV style
rotator such that the readout was a digital panel meter that was scaled for
degrees.
Does anyone recall the article- year/month?

Tnx,
Dale W4OP

Before you go to a lot of trouble check out
http://www.starkelectronic.com/rotor.htm#rotor

It works very well as advertised. It used to be available as a control
box alone. I have one that took a lightning strike that killed the PIC
microprocessor. Unfortunately, the only chip with that pin out is a
one-time-program device.

If you choose to Home brew it you will need to be aware that the three
wire devices consist of two motors, clockwise and counter clockwise.
The position is determined by the run time on the motors. A
calibration cycle is needed occasionally but it works well.

> Hello All,
> I was told by a ham during a QSO that if I buy a matched pair of 6146b's,
> I would not need to neutralize them?? Is that true?
>
> Thanks KB3IBT

I've read where certain resistors in the hybrids served double-duty as fuses. What gives?

Usually the resistors, if you overload your rig for extended periods! <g> As I've told lots of other people, the first thing I check when I unbutton a rig is the cathode and screen resistors. That gives me an immediate indication of whether the rig has seen some abuse during tune-up or operation.   Kenwood made the cathode and screen resistors in the final section just large enough to do their job, with a little room for beginning operators learning to tune it up properly. Before any real damage can occur to the expensive items, like the power transformer (priced one lately at kenwoodparts.com?) or the final tubes, the cheap resistors will give it up. Cheap, simple, and quick to replace, they have saved many, many Kenwood hybrids from the bone-pile.   See my further description HERE.

How can I tell when my cathode resistors are cooked?

The easiest way is to measure them, with a zero-adjusted ohm-meter. From cathode to ground, it should read 5 Ohms, +/- 5% (4.75 to 5.25 Ohms). You can see tell-tale signs without opening the case, however. The plate current metering is read from the cathode voltage, and the higher the cathode resistance, the higher the plate current reading. Also, the lower the output power.   If you read high plate current and low output power, those cathode resistors are probably climbing in value!   The plate current is actually lower than what you are seeing, and the output power is just confirming it. Time to order some replacement resistors!

How do I know when I have bad final screen resistors?

The final screen voltage directly affects your output power. It is the basis of most QRO mods, just raise the screen voltage beyond the Kenwood design values, and viola! More power!. Since we already know we probably don't want to RAISE the screen voltage, what we are concerned with here is too LOW of a screen voltage.   Again, the failure mode of resistors is to go UP in value when they are getting cooked, and that will also lower the screen voltage in the Kenwoods. If your fresh finals are not providing an honest 100W output, and if you have plenty of drive, it's probably a good time to check your screen voltage, and the value of the 100 Ohm and 470 Ohm resitors in series with the screens.   There can be other causes, but let's go with the most common, and check those resistors first.

How can I tell when my finals (6146's) are getting "soft?"

Tubes go "soft" when their cathode emissions begin to drop. That means that for a given set of circumstances, plate voltage, screen voltage, drive level, etc., fewer electrons make it from the cathode to the plate. When this happens, plate current begins to fall off, output power starts to drop, and we start to increase the LOAD control and re-dip to maintain the power output. As we increase the LOAD control, and more heavily tax the finals, the tuning starts to get broad, with a much less pronounced "dip." This can occur gradually over time, so we tend to overlook it. Finally, we're seeing 70W out on 20M with very broad plate tuning - It's time to replace the finals. Fortunately, for Kenwood, this can take over 35 years, depending on your operating habits, as I get lots of rigs with the original S2001 tubes in place, almost as good as new!

When should I replace my 12BY7A driver tube?

The ALC metering directly measures the performance of your driver tube. Usually, when the tube starts to go soft, it will be hard to obtain full ALC swing on the highest bands. 10M will always go first. As long as you have sufficient drive to get well into the ALC range on the bands that you work, the tube is fine. When ALC drops to zero on bands of interest, it's time to replace it. You need ALC indication for the speech processing and other features to work properly, so don't operate in the grey areas ouside of normal ALC readings.

In your Tune-Up procedure, you intimate that 225ma is a sort of "Magic Number" for plate current. Why is that?

When we're adjusting the plate and load controls during tune-up, what we're actually doing is attempting to match the output impedance of the finals (the two 6146B's in parallel) to the 50 ohm load. Maximum power transfer always occurs when we match source and load impedance, and for a pair of 6146's in good condition, with nominal plate and screen voltages as found in the Kenwoods, that turns out to happen at around 225ma indicated plate current. 800VDC X 225ma also turns out to be 180W DC input, right at Kenwood's design goal. If you watch your output power as you increase loading while re-dipping, you'll see increasing output power until Ip reaches about 225ma, then it starts to come down again. Plate current will be higher, but power out will be lower.

How can I Neutralize my Finals?

Neutralization is the process of compensating for the inter-electrode capacitance of the final tubes. It helps prevent the tubes from oscillating, and allows them to perform as a stable amplifier. Here is a simple sequence for neutralizing your finals:

(1) Tune up normally into a dummy load on 10M, perhaps 28.1 MHz

(2) Turn your SG (Screen Grid voltage) switch OFF. This effectively turns off your finals, and will prevent them from putting any power into your measurement setup.

(3) If your dummy load has external connections to monitor the RF it is seeing, use those - Otherwise, remove the dummy load and replace it with a 50 ohm resistor (47 or 51 Ohms, 1/2W will work fine) that is mounted onto a PL-259 Plug. During neutralization there is no significant power in the load, so use what's handy.

(4) Using an RF millivoltmeter or oscilloscope with at least 20MHz bandwidth, connect it across the small 50 Ohm test load. A 20MHz scope will display 28 MHz adequately, although it won't accurately measure the RF voltage present. That's OK, because when we neutralize, we're simply tuning for minimum output.

(5) Key the rig and observe the output voltage on your RF VTVM or Scope. This is the drive power "leaking through" to the load with the finals inoperative. Our goal here is to minimize this leakage, and in doing so, we will ne "neutralizing" the inter-electrode capacitance.

(6) Using an INSULATED tool, either plastic or a carved wooden dowel, tune the neutralization capacitor for minimum output. You should be able to get down to 10 millivolts or so. There is LOTS of voltage present, so don't even THINK about using a metallic tool!! You will spark and arc and create

all manner of scarey fireworks if you do - Not to mention perhaps joining the ranks of the SK's . . .

Don't forget to return your SG switch to ON for normal operation.

Why Can't I Successfully Neutralize my 6146A's?

The Kenwood's were designed around the 6146B, which was significantly different from previous 6146 and 6146A versions. You should not use the 6146, 6146A, or 6146W built before the mid-1960's in the Kenwoods. After the 6146B was introduced in 1964, the 6146W's gradually were migrated to the 6146B design, and later versions of those tubes are fine. The neutralization circuit employed in the Kenwood hybrids was designed around the 6146B, and may not be able to successfully neutralize the older versions - That can lead to instability in the finals.

What should I do after changing Finals?

Whenever you change finals, you must read and understand the following information whether they are NOS U.S. or of foreign manufacture.

Absolutely every time you change the finals in your Kenwood, you MUST do two things: (1) You must adjust the bias for the new tubes, and (2) you MUST neutralize the new tubes. Simple stuff, but you have to take these two steps to avoid problems.

Whenever you install new finals, the following steps for adjusting the bias MUST be followed. Install the new tubes. Turn the bias pot full CCW (No bias). Turn on the rig and heaters. Turn your MIC control full CCW (no gain). Set your BAND to 14 MHz (20M). Set your MODE control to USB.

Flip the SEND switch to TRANSMIT and adjust your bias for 50 ma.

Why is this important? All tubes from different manufacturers or eras show differences in operating characteristics. You have to tune the factory provided adjustments to compensate for these changes when you swap finals. It may take a few minutes, but it is well worth the effort. Your new tubes will be operating safely, and will then provide many years of peak performance.

For neutralization, see the FAQ question a few steps above this question.

looks interesting. Checked the AD website and the specs on this chip
are currently very early. No pricing is posted yet and I'm not sure
samples are yet available (AD will send free samples to hams).
I'll have to keep an eye on their web site from time to time for
updates. And when a circuit board is available PLEASE post the info here!

i thought i did post the model #. dont know what happened. will have to dig
it out again. Wife got a hold of them and gave one to the church and one
became our personal oven so i cant tear it apart. I have long since been
forbidden to do that unless it is really broken.

Rats, service manual just shows it as a box, but I did find some useful info
here

http://fusor.net/board/view.php?site=fusor&bn=fusor_hvpower&key=1158786921

Knowing the freq they switch at would be a big help

Jimmie

Thank you all around!

I went through a couple of display motherboards, and looked into the specs of all power devices.

What their applications have in common is being rather high current and low frequency. You don't find much rated to work beyond fery few MHz, and with very large capacitances.

Examples:

- power MOSFET capable of switching 600V, 10A peak, with 2200pF gate-drain capacitance

- bipolars that can absorb several watts, but no higher than a couple of MHz

- horizontal finals yjat are included in fairly complex ICs with lots of ancillary components in feedback and protection circuitry - at least in CRT VDUs from the last 10+ years.

I have no doubt some RF can be teased out of these, but it seems to me it would be at the price of major design complications.

The advantage of tube finals was that their high-voltage low-current and low-capacitance nature lent itself to functioning also at higher frequencies than those of typical video circuits.

Next I'll look into TV distribution amps. I remember that transistors in those were designed to linearly pump a lot of different signals up to UHF, and that they tended to run hot - and 24/7.

Look at RF transistors from the surplus houses if you want to save bucks. Up to 10MHz or so you can use MOSFETs designed for SMPS service if you're careful with the gate drive circuit, and they'll be dirt cheap.

Brand spanking new transistors that'll handle a few watts at HF are a couple of bucks each, you can get up to 10W out affordably -- why do you want to muck around parting out consumer electronics of uncertain provenance?

Many products still use RS-232 (albeit at TTL voltage levels) internally and just use, e.g., an FTDI USB<-->RS-232 converter chip (such as the FT2232R). This is actually easier than using a USB microcontroller, although it does tend to end up being a little more expensive as well (i.e., $5 for the FTDI IC, $5 for a microcontroller vs. $5 for a USB controller).

curiosity and hack value, not much else!

there are good transmitter kits that are worth more than the effort
(and cost too) of ordering ones of each component

if you have some junk, though, it may be worth a thought :-)

Next consideration....not having to hand any components or
experience of the broadcast TV band (0.4 - 1GHz?) I wonder
what tuners and mixers are fitted to modern TVs and if anyone
can recommend a tuner separate from a main board that
might be used.

Also, where tuners are driven by I2C and similar busses, are
they channelised to fit the standard TV channels, or do they
have a delta frequency, say, 10kHz, that might be useful
for a spectrum analyser?

The HW-101 (OK, it had a couple semiconductors in it but I won't hold
it against it, it's still a "tube rig") was still for sale by Heathkit
up till 1980 or so.

That'd be 27 years ago.

Tim.

A few years ago at FDIM, George Dobbs did a presentation about some guy whose main interest in the hobby was making complete rigs from PC monitors. He strenuously avoided using any parts that couldn't be scavenged from a monitor, so obviously, his designs were a little unusual. Getting in contact with George if you're not in the UK can be an exercise in frustration, and I don't recall the call of the guy he was talking about, or even the country, for that matter (I think it's the brains leaking out that's turning my hair gray).

I think it would have been in the 2005 FDIM proceedings, possibly 2003, but I think 2005.

Because it is off topic.

I'm tired of newsgroups being cluttered with posts that belong elsewhere.
And most of the time it is because people can't be bothered finding
the most appropriate place to post.

There's a whole rec.radio.* hierarchy, yet you chose to post in one
about the building of amateur radio equipment.  That doesn't say much.

Asking in the local newsgroup would actually be more on topic than
asking here.

Sorry Michael if I made you mad. I did say this  was an OT... and I
personally don't think this place is " cluttered ".  If  someone here knows
a better newsgroup for me to ask, please let me know asap, as I did check,
but couldn't find a better newsgroup... I just thought you guys would know
better as you probably have a good knowledge of antennas and receivers...
you can reach me privately at herbeapuce@hotmail.com  if you have any info
for me, some  reviews or links. Best to you. Stef.

Lots of examples of IRF520 MOSFETS and similar in HF output stages and
amplifiers out there, monitors also tend to have nice stuff like HV
caps, ferrites and as another poster mentioned, the video circuitry on
the tube base (often) has some nice transistors that will work up to
VHF.
>Brand spanking new transistors that'll handle a few watts at HF are a

Spirit of experimentation? I thought homebrew was all about that,
nothing like being able to tell a contact that the TX was built out of
scrap you got for free.

These can be handy for switching stuff on and off, regulators, DC-DC converters etc.

> - bipolars that can absorb several watts, but no higher than a couple of MHz
>
> - horizontal finals yjat are included in fairly complex ICs with lots of ancillary components in feedback and protection circuitry - at least in CRT VDUs from the last 10+ years.

I doubt this - the vertical output is in an integrated IC, but the horizontal output is normally just a transistor, often with a built-in diode across the collector-emitter, but in the direction such that it won't bother you in any sensible circuit. They are mostly pretty slow, since they're high voltage.

> I have no doubt some RF can be teased out of these, but it seems to me it would be at the price of major design complications.

Or you could say that you would get a sense of accomplishment when you've succeeded. Some of the transistors are mot so bad - e.g. I got a few 2SB772 (PNP) and 2SD882 (NPN) (10-Watt 30V, 3A, fT>80MHz) transistors out of a monitor, that'd be OK for a QRP transmitter I think.

> The advantage of tube finals was that their high-voltage low-current and low-capacitance nature lent itself to functioning also at higher frequencies than those of typical video circuits.

I did find a 2SC3675, which has an output capacitance of only 2.8pF and a VCEO of 900V. It is slowish (fT=6MHz), so I might use it as a cascode in a high voltage audio amplifier for driving electrostatic headphones.

The video amplifiers in a monitor have to be pretty fast for high resolution signals, and often these are discrete transistors to handle the power. I got some 2SC2682 devices out of monitors - 180V, 3.2pF, fT=200MHz, 10W - a few of these could make a useful amount of RF, I reckon.

> Next I'll look into TV distribution amps. I remember that transistors
> in those were designed to linearly pump a lot of different signals up

And, it's not a STEENKIN chat room. The thousands of amateur radio
operators that follow this ng aren't following the postings on a
minute by minute basis.

What made the OP think that The Answer -- much less _any_ answer --
should be forthcoming in an hour or two? It's probably _days_ before a
majority of rrah participants read any individual post.

Now, with the selfish, whining followup by the OP to his own post, there
will be doubtless _far fewer_ , if any, followups by folks who might've
had a good recommendation (even tho' it's OT.)

Stef in Montreal

This is the Amateur Radio "Homebrewing" focus group. So to bring your request a bit more "on-topic", why not design and build your own radio equipment? Think of the fun and sense of satisfaction you could get from using a radio set that you have designed and built. It's easy...we do it all the time.

Arv - K7HKL

------------------

to Arv - K7HKL , thank you for your suggestion. Right now I can't really
commit on building/studying a radio. But thank you very much for being kind,
willing to help,  and for your Proactive attitude.

And please people, may this tread die right now so no one else (not
including you sir) get irritated by my diabolic mistake ..

Regards

Stef.

For FM in remote areas you'll need an external antenna, like a
telescoping whip. For AM you most likely won't need an external
antenna, I've heard AM stations from a thousand or more miles away late
at night all snuggly in my sleeping bag.

Take a look at
http://www.ambientweather.com/mi300wobare.html
It does more than just AM and FM but it's only $26 and available in five
colors.

Something like
http://www.ambientweather.com/etgrframrafl.html
never needs batteries and can charge up your cellphone at the price of
$50 and some elbow grease.

The Grundig/Eton brand has never disappointed me, you may want to try
rec.radio.shortwave as suggested for more in-depth suggestions.

Enjoy!

A month ago a new FM Radio station was launched in our city. Since
that time my car radio (2 years old) had been hijacked. Whenever I
pick another station it plays for a split second then the radio scans
to the new station. Can you tell me what it going on and what I can
do about it?

Thanks

Bruce

Sorry for the hiatus, I had an exam to submit over the weekend and work is being a time hog at the moment.

Re something with a few watts of drive, I do have a couple of ham friends, who might be able to provide this if I brought the project to them. Only problem is that the power supplies et al are spread over the workshop at the moment, but this might be a good route if I cant get any further. It has occured to me that I might have broken the tube, melted the grid or something, so this could prove the tube works.

I have studied up on the tube capacitances and the interaction in the circuit, and decided to rework the project into a different design - either hartley or colpitts. Have come across a patent also that describes exactly what I want to do (tube amp for plasma excitation), and they use a modified hartley. But looking at the colpitts, I like the way that the tube capacitances are in parallel with the tank caps. They should swamp the tube values I think.

Re the 12V supply, the idea is that the resistor biases the grid (at DC) to ground, the cap smooths the current through the resistor, and as electrons flow into the grid and make it more negative, at 12V the diode starts to conduct and clamps the DC grid bias at -12V. Of course, the tube end of the grid circuit is being driven high and low by the coil, so this shouldent clamp the grid voltages - just the grid DC level (bias). Thats the idea anyway - might be missing something. I have checked grid current and it peaks at about 50mA with the voltage cranked up to about 2kV IIRC.

Re choosing 25MHz, I originally was shooting for 50MHz but had no joy getting the circuit to work. It worked great at 5 MHz or so, so I felt a compromise would be 25MHz. So thats where I am currently aiming for. The higher the frequency the less reactance I will get from the 'load' if I drive it capacitvley which is what I want to do (because of striking the discharge, which is difficult to do inductivley). There is a need to seal the plasma tube for certain experiments to raise the pressure in it, and some of the substances I wish to excite are not compatible with metals (an example is sulphur, which is a major part of the experiments, and its performance is described in various patents - its usually excited with microwaves in the current art, but I want to use very small discharge chambers which make this hard) so I cannot have any metal in the discharge envelope (I also have the kit onhand to make these quartz glass capsules).

As you say I have heard of 13.56MHz also as a standard frequency for this kind of work, but I am aiming higher for the above loading reasons.

Now, as for grounding the grid, I have considered it, but have not come across any designs of oscillators where the grid is grounded, and I dont have enough confidence in my circuit redesign skills to work out the details myself. I could of course work out the circuit, but what Z will be where, and how is this related to that phasewise - an example is the increased capacitance from the anode to the case (which is now the grid). Just dont know.

I will get some photos of the rebuilt thing once its a colpitts, I am also replacing the caps with some homemade ones made from heavy copper foil, since I am a bit unsure of the quality of the russian doorknobs I am currently using.

Finally, is this a uni project - well, not yet, but I am a physics undergrad and am studying some related fields, so you could say its related. It also relates to some harder core physics experiments I want to start soon, with a cyclotron being one project, which I need powerful RF drive for. Its all great fun - unless you cant get your damn RF power house to work!

Current interest for this project relates to finding a discharge lamp (high intensity) whos spectrum compliments the zooanthellae photosynthesis absorbtion of marine corals. I could write a ream about this but its off topic so I will leave it at that for the moment. But its a means to an end currently - although I would like to have a power oscillator capable of spanning 1 to 100 MHz at several hundred watts for plenty of other experiments.

Thanks for the contributions so far. Hope to nail this one soon.

Having been donated a homebrew "L" antenna tuner, with an unidentified roller coaster (about 1 1/4" in diameter, with a plastic facia turns counter marked "antenna loading" with the plastic facia looking like a CRT's barrel distortion, any ideas as to its origin, anyone?) but a fairly large domestic tuning capacitor, I needed to remove the gunge that had accumulated after some years in a garden shed.

Lo! And behold! An ideal tool is to be found in dental floss, a bit difficult to thread it between to start with, (hook it with a paper clip) but once going, it's in its element!

Perhaps this is what's causing your problem?

http://www.ksat.com/technology/13762279/detail.html

(quoted text)

Drivers don't have to adjust their car's radio dial, because some Des Moines stations are changing themselves.

A new digital signal is causing a few glitches for some car radios.

The problem started a few weeks ago. Fans of 93.3 FM and 102.5 FM noticed their radio station presets would sometimes refuse to stay on the right station.

Drivers would find that when they push their preset button that is set to 93.3 FM, it stays for a second and then switches back to 102.5 FM by itself.

GM and Chrysler dealers are trying to repair car radios in Des Moines.

It turns out it's not the radio, it's the signal.

Des Moines Radio Group, which owns the two stations, just began broadcasting a digital signal.

In some newer cars, that signal will tell drivers what song is playing and the artist. It's that signal that is confusing some radios.

"There are always quirks and growing pains with new technology, but this is the strangest I've seen," said Joe Farrington, chief engineer of the Des Moines Radio Group.

The radio station said it is aware of the problem and will replace some equipment will have it fixed in a month or so.

Doug, brilliant...in response to your heads up, a quick google brought
up numerous pictures to confirm it.

Thank-you...arigato gozaimus!

The next question for all is....how to clean up the green verdigris that is
on some parts of the coil, and also the brass pulley that runs up
and down the coil.....ie...how to clean it but without doing damage
for the future. (And I suppose that means that taking that exercise with
yesterday's antenna exercise that in the space of 24 hours I will
have done everything that Mrs.Nugatory has ever done, plus
all the other experiments (including some mistakes about
which I'm not the least embarrassed) as well!)

Maybe you could look at tuner boards form an old VCR, On VCR's Circa 1990
the tuners were a separate board, Older tuners were simply fed by a PWM
output from the display / timer CPU that was then fed to an amplifier/
smoothing stage that then gave a 36V down to 2V DC voltage to select
frequency, they were analogue tuners, so not stepped, there was usually
another line to the tuner to disable the AFT lock that was used when
scanning for new channels.
We used to take the VCR tuner board, put it in a box with a PSU, pin the
AFT lock line to 5V to disable AFT then use a 10K pot with a 2K or 3K
fixed R on the 0V leg, the wiper to the collector of the transistor that was
after the PWM input line.
The modules used in the VCR's were usually Mitsumi or Alps, and if you get
hold of an European one. then you can tune VHF and UHF with it, but you will
need to apply 5V to the band switching pins on the tuner. and yes it can be
used as a basic spectrum analyser, but you may have to find a way to disable
the AGC circuits.
Also the tuner boards rely on the RF output modulator / pass though unit on

the back sockets of the VCR having considerable gain, without the modulator, the signal would be weak.

    Snipping here....
     Actually, toothpaste works very well. Its a detergent
and very mild abrasive which will often remove oxidation
without taking off too much metal. Brasso is too strong and
leaves a residue behind. There are cleaners with reducing
agents such as _Barkeepers Friend_ which are quite effective
in removing oxidation but they may also remove all the
plating where something has only a thin plating of silver or
chrome. Remember, the oxidation itself is metal that has
been removed chemically from the surface of the object. I
don't know of any way of replacing it other than replating
which is not always practical. Your roller inductor is/was
very likely silver plated.
    Use the mildest cleaner first and more powerful agents
only if it doesn't work.
    A toothbrush is an excellent cleaning tool.

Quoted from the Telstar Web Site:

"Whether you're whispering or shouting, VoiceMax holds your
transceiver at 100% modulation allowing you to punch through heavy
channel traffic without sacrificing voice clarity."

So, it is for AM modulation systems. The previous poster was

right...it is CB equipment! Telstar says it is, so who's to argue
with that.

Give it a good clean with IPA first to get rid of the grime then one of the pan scourers intended for non stick pans usually removes most of the oxidization. Don't use anything too abrasive as the silver plating is can be rather thin.

Steve H

P.S. Sorry about having to change your call but the news server has it
down as a "bad word"

I STRONGLY suspect that what's going on in Des Moines is an improperly-configured RDS encoder. This is not directly related to the new IBOC digital radio system in use here in the States, but it seems that the IBOC digital encoders also include an RDS encoder for the station's analog side.

RDS is a 57KHz subcarrier that transmits low-speed data. Information like the name of the station, a "program identification" code that's invaluable for DXers as it often maps directly to the call letters (continuous ID!), sometimes the name of the song/artist that's on the air right now.

It also includes an "alternate frequency" field. This idea came from Europe where a single station may have a number of transmitters on different frequencies. The station places all its frequencies in the "AF" field on all its transmitters. If the radio senses the signal it's tuned to isn't coming in well, it tries the other frequencies in the AF list, looking for a better choice.

Multiple-transmitter stations are MUCH less common in the U.S.. I would imagine many station personnel don't understand what the Alternate Frequency (AF) field is all about. My guess is that when KIOA-93.3 configured their equipment, they entered the frequency of different (but commonly-owned) station KSTZ-102.5 in the AF field -- and didn't enter their own frequency of 93.3. Presumably some models of radio interpret this as indicating not that 102.5 is an *alternative* frequency of KIOA, but the *only* frequency.

I've heard of similar problems in other cities. The IBOC digital deployment is resulting in RDS installations in a LOT of stations that haven't used it before, and there seem to be a LOT more RDS-enabled receivers than there were a few years ago.

This is very handy when you're driving cross-country. The car radio can hand off from one transmitter to another, while staying on the same network. This presupposes national radio networks, of course. :-)

They also have the ability to switch to a different station for traffic reports, then switch back to whatever you were listening to. This is sometimes jarring, but I understand the reasoning.

We have nationwide radio networks in Canada from the CBC, but don't use RDS. Too many AM transmitters to make it work; probably other issues too.

We played with DAB for a while on L band, but have quietly walked away from it. There's just one multiplex still on the air here in Vancouver.

I've often thought wide band FM ham radio (e.g. 10 GHz) could benefit from RDS ("VE7LDH 10.2 GHz QTHR QSL via buro").

Some CBC stations did run RDS for awhile, but I don't recall any of them using the AF field. (but I only ever saw RDS on the ones that made it into Tennessee via sporadic-E) I understand they were somehow used in conjunction with a data-paging scheme, and when that scheme went bust many of the encoders were shut off.

There really aren't that many AM transmitters left -- offhand I can think of St. John's (NL), Windsor, Winnipeg, Regina (Watrous), Edmonton, Calgary, and Vancouver. The four on the Prairies all have FM relays within the city centre, so I'd imagine the majority of the audience is listening on FM even there. Apparently you *can* specify an AM frequency in the AF field - I've seen it done - though while you can direct a receiver *from* FM *to* AM you obviously can't do it the other way around.

> We played with DAB for a while on L band, but have quietly walked away
> from it. There's just one multiplex still on the air here in Vancouver.

Yeah, that's unfortunate. Your system provides more choice, better quality, and no interference to the existing analog service. I suppose the lack of economies of scale with the U.S. market doomed it. The CRTC is now considering allowing our IBOC system. (and the CBC has tested it in Toronto and Peterborough) They seem VERY leery of authorizing it on AM though.

> I've often thought wide band FM ham radio (e.g. 10 GHz) could benefit

Interesting idea.

Reportedly some new iPod transmitters include RDS encoders (?!) (along with some kind of scheme for reading the song title/artist data out of the iPod) so apparently encoders are available at consumer-practical prices. The standard is no secret, so someone adequately skilled would probably have little trouble building one.

There are still Radio 1 repeaters on AM in small towns. All the new
stuff is on FM. There was a major stink a few years ago when CBC
Toronto traded in their old AM frequency for the last available FM
frequency in the Toronto/Hamilton/Buffalo area.

> though.

The main push for digital radio here is now Sirius. We were using
totally standard Eureka 147, albeit at a different frequency than
Europe. It works, but suffers from spotty coverage due to lousy

transmitters - if they had continued to build it out, it might work better. But the one piddly little transmitter left on Mount Seymour gives surprisingly good coverage. I bought a little DAB radio at Radio Shack, and it works just fine.

One issue that has been raised as a stumbling block to DAB in the Americas is that multiplexes require stations to share a frequency - stations that are otherwise competitors.

The only remaining multiplex here has the three CBC English networks and the two CBC French networks. The other multiplexes, before they were turned down, had stations owned by the same companies on them (Corus, CHUM).

We (hams) have oodles of bandwidth in our microwave bands. We could play with this stuff too.

Years ago I was told to use women's Lipstick for cleaning surfaces where the smoothness of the final finish is important! They said it is very mildly abrasive. I think I'd test it for residue before I got too carried away.

Also be a little careful of the color?

They said to apply it with something smooth such as a piece of chamois on a popsicle stick?

Good Luck!

Young

Absolutely, though those are disappearing too. I saw one in Iron Bridge, Ont. two years ago - a wire about 15m long strung between two phone poles, a surprisingly stout building housing the 40-watt transmitter. Maybe that was Premiere Chaine, not Radio 1? I forget...

Here in the States duopolies have led to the situation where one owner would be able to use an entire multiplex pretty easily. I think the real stumbling block here was that Eureka would give Acme Radiocorp's 250-watt daytime-only AM station exactly the same coverage (and full-quality audio) as XYZ Broadcasting's 100kw FM. XYZ would rather not have the competition.

Radio 3 is on the air on DAB?

German hams have been messing with amateur digital TV - their board supports our ATSC standard too.

I must confess that I'm not familiar with "inverter" type PSU's for
microwaves. However judging by the old type you would literally be
"playing with fire" in using them for a TX PSU.
Based on the "Don't put it in unless it's needed" philosophy it
1. Won't have ANY filtering worth mentioning. In fact the output will
probably be a series of rough square waves giving about +2KV average
voltage.
2. I would be quite sure that an 807 based linear would turn into slag
with 2Kv on the plates, let alone 2KV squarewaves at about 25KHz.

This is based on the fact that microwave ovens use cavity magnetrons.
these need a small heater voltage and a beefy but rough HT supply.
They are just a diode in a powerful transverse magnetic field.
After all your coffee or soup isn't a sensitive soul about signals!

Now if you had a linear needing 2Kv or so (maybe a California
Kilowatt!!!) and a good supply of high voltage caps then you might be
getting somwhere.
You would indeed have the advantage of needing less smoothing because of
the high switching frequency of the inverter but any choke would have to
be suitable for 30 KHz at least with powerful insulation.
But with decent TX tubes not being cheap I still reckon I would prefer
one of the old HV transformers with plenty of fuses.

Best of luck!
73's ZL1BDA ex G3NIA.

Please see http://www.cybertheque.org/homebrew/837_linear

This design is not mine but I documented the layout, construction,
and circuitry of a quad 807 (837) linear from silent key
K9KLN. It used a 2KV power supply ;)

Regards,

Michael

Basically I want it for educational(my education) purposes. I had to give up the ovens I got at the goodwill to my wife so I am waiting on another one to show up..Bsically I want out learn about the design of the power supply. I figure it can be much improved but dont see why the idea of using a n inverter would not work for rf amps. I want to learn about the magnetics used and the operating frequency to hopefully design my own inverter type power supply. I was thinking of something along the lines of the old 12 to 600volt inverters used by HEath for their old mobile rigs. But I want to use them off the mains, input 300vdc output up to a couple of KV. Presently I have a couple of inverter transformers salvaged from some old tube type CB amps and the plan is drive them with a couple of IGBTs. First I need to get them operatin as designed so I can figure out for what freq they were designed.

Jimmie

Had a look at the old quad GG 807 type linear.
COR! that's a real old bit of ham radio.
My own experience with 1625/807's is that with more than 1KV on the plate they didn't survive long. Any mismatch or offtuning and flashover happened pretty fast. Back in the 1960's I had quite a bin full of duds that went just that way.
Recently I had a fault in my modified kenwood 820s which destroyed 2x 6146B's in a similar way. That's with only 850v plate voltage too.
However it is true that linear amps tend to work better in a high voltage/low current mode, provided the finals can take it.
My old home brew 100watt linear used a TT21 (KT88 with a top cap plate) and that worked fine with 1050 volts. Nice and linear and 66% effecient on 14 Mhz (measured).
I once built an 811A GG linear but never needed the extra power so it nevergot on the air.
Regards Cliff Wright ZL1BDA

Subwoofer/Amp project...

(Playmaster 300W subwoofer amp)

While walking down the hall around lunch time I walked in on a discussion about surround sound home theater systems. After humbly admitting I watched movies through my two channel stereo I was prodded by my peers to get with the '90s, I started checking out the technology.

The following week I saw a used Carver surround sound processor for sale on the net. Perfect for upgrading my late 80's vintage two channel stereo. However, a suround sound system requires three front speakers (left, center, right), two rear (left and right), and a subwoofer. The five channels provide the spacial realism, while the subwoofer provides the physical realism... that is when Apollo 13 takes off one should be able to feel the vibrations in the chest, and when the horses cross the battle field in braveheart, it's the subwoofer that allows one to feel the horses through the vibrating floor.

While I had other equipment to get by on the five channels, I was short on a subwoofer, so I did some research. The short story is that I built my own powered subwoofer (actually 2) and learned alot in the process.

Here are the details...

Some info on subwoofers
Speaker Building Information Sources
Subwoofer Project
Subwoofer Construction
Amplifier Construction

Some info on subwoofers...
Difference between a woofer and a subwoofer... subwoofers are usually only used to recreate a sub portion of what a woofer will. While a typical woofer may have a frequency response between 20Hz and 2k Hz, a subwoofer usually has a crossover that limits it's frequency response range from 20Hz to maybe 80-150Hz. Component wise (the cone/coil thing) woofers and subwoofers are the same. There are passive subwoofers and powered subwoofers. Passive subwoofers are powered by your stereo's amplifier. Powered subwoofers is the same as a passive subwoofer except it has it's own amplifier for driving the passive subwoofer. Your stereo needs to have a sub woofer out (line out) for a powered subwoofer. Since most power produced by your stereo's amp is consumed by driving the low frequencies of your speakers, it's a big win to have a separate amplifier for driving the low end. This way mid range won't suffer from the power consumed by the low end.
There are several designs for a subwoofers. Some of the less exotic ones are are ported, sealed, and band pass enclosures. Sealed enclosure's advantage is that they can exist in a much smaller enclosure, however this is at the cost of efficiency and reduced low frequency performance. Ported enclosures are the most common. These have a tube called a port which serves several purposes. It's important that this port be tuned to the driver (woofer) and volume of the box or else the sound may result in unclear, muddy bass. The affect of a properly tuned port with the woofer is similar to blowing a wine jug like an instrument. A band pass enclsure looks like a box with a hole or slit. Bose subwoofers are band pass woofers. The idea is that only certain desired frequencies (bands) end up passing through the hole or slit while the others are absorbed internally.

There's a thing called a crossover to consider. A crossover is like a frequency filter except rather than filtering out frequencies, it redirects frequencies to other channels. A typical powered subwoofer will have a built in crossover that directs low end frequencies (usually < 80-150Hz) to your subwoofer while sending higher frequencies on to another channel (the rest of your speaker system). The high end frequencies rapidly diminish in the channel sent to the subwoofer and the low end frequencies rapidly dimish in the channel going to the higher frequency response speakers. So the tweeters get the high frequencies they are designed to produce and the woofer get the low frequencies they are designed to produce. Almost all multi speaker system will have some sort of crossover. separating frequencies between tweeter, midrange and woofer. In crossovers, there are both passive and active crossovers. Passive crossovers are typical in most speakers. Since they take their power from the incoming signal, they do have an impact on power/responsiveness. Active crossovers get there power externally. However we're starting to go beyond the scope of the subwoofers project.

The prices for powered subwoofer can get pretty expensive. I was looking at models between $200 and $1500. $1500 for a 12 or 15 inch woofer plus amplifier just seemed ridiculous considering the cost of parts to make them... So, I decided to look into making my own. The route I chose to take was not cost effective if time for learning, designing, and implementing is factored in. However what I've learned while doing this makes it all worth while.

Speaker Building Information Sources
I started with two books I picked up at Radio Shack called Speaker Building and Advanced Speaker building. Both are heavily oriented torwards building speakers with Radio Shack speaker components, and can almost double as a Radio Shack speaker catalog. Lot's of shameless Radio Shack marketing through out. They have a nice intro into building speakers, with a lot of the theory left out. The first book contains graphs to crossreference parameters required to make a speaker so that one doesn't need to use a calculator. The advance speaker book throws in some formulas but is a little lacking in discussion on how the equations were derived. In case you don't know how to plug a formula into your calculator, no worries... the Advanced Radio Shack book will tell you which buttons to press.
Vance Dickason's "The Loudspeaker Design Cookbook" (ISBN 1-882580-10-9) was recommended by several sources. It reads like a collection of white papers on speaker building theory and is heavy on the technical side. Towards the end it contains several commercial advertisements for part sources. Good book.

There is quite a bit of wave theory, frequency dampening factors that needs to be taken in to consideration. Everything from cone tensile strength to acoustic frequency dampening of dacron fiber fluff or maybe beach sand, resonant frequency of particle board versus a harder wood, etc., etc. factor into the volume of the box and the optimal length of the port so that it resonates properly. So many factors, it takes some time to become comfortable with weeding out the meaningful parameters from those that are negligible in the quest for making the ultimate speaker. Box dimension I later learned really dosn't matter much for a subwoofer. The main concern in box dimension is standing waves where waves are cancelled out to the tune of +/- 5dB in the worst case. Sufficient dampening material inside to absorb standing waves can cancel this out. In the case of subwoofers, it's not an issue since the box dimensions are so much shorter than the wavelengths (20-100Hz).

Here are some information sights I've found on the web....

Subwoofer Project

Being a neophyte in the audiophile world, my first thought was to get the biggest driver I could find to produce the lows and push volumes of air that one could feel. I ran across some 18" woofers, however I liked the specs on some 15" woofers I later found better. After doing the calculations I found that for my ported cabinet, I would need an enclosure that was 14 to 24 cubic feet! I decided that there is no way I would want to dedicate this much space in my living room to a box this big. These calculation were based off of an optimal volume formula I got out of the Radio Shack books. I later discovered that this optimal volume didn't agree with the manufacturer, several software design packages, and the loudspeaker cookbook.
An alternative was to go with a sealed enclosure, however this reduces the responsiveness and pushes the F3 upwards. End result is a subwoofer with a reduced ability to produce low end. Since it seems the whole point of having a subwoofer is to produce the low frequencies, a sealed enclosure which raises the low end didn't make much sense to me.

I opted for a 12" woofer with a 3 cubic foot enclosure. I decided to go with Ultimate's AU1290 "Attitude" woofers. They have a frequency response range of 18-1k Hz. They have a dual six ohm, 90oz magnet, 2" kapton coil capable of handling 500 watts sustained, 1000 watts max. Headroom is .44". SPL is 88.9dB, but I don't care about this since it'll be driven by it's own separate amp with it's own gain control.

Test Data from Factory:
SPL 88.9dB 1W/1m
Fs 23.5Hz
Vas 5.3
Qts .38

I decided to go with 3 cubic feet ported enclosure since that would give me the lowest frequency within factory recommendations.... With a 3 cubic foot enclosure, this driver has an F3 of about 26Hz (pretty good!). I decided to go with a 4" diameter port tube since that would give me the least amount of port noise. The port for this is about 14" long. I ended up picking up some PVC tube at the hardware store. This worked quite well.

Subwoofer Construction

I decided to make a prototype out of particle board since wide oak boards are expensive and I was afraid of ruining them, especially since I have very little wood working experience. Particle board cost about 1/8 the price.

Being new to wood working I only had a circular saw which I had learned through experience is not for precision wood working. I was able to pick a used craftsman table saw in perfect shape for about a third of the price of a new one. And this is what I built the prototype with. For the speaker and port hole I used a saber saw.

The prototype came out pretty good. Some things I learned from the prototype is that cross bracing is important so as to cut down on the side board vibrations. Also, all seams should have a good fit and must be well sealed. I used some silicone wood calk I picked up at the hardware store. If the seams aren't sealed, the gaps tend to make a raspy whistling noise when the driver is pushing large volumes of air.

I picked up a used 60's vintage radial arm saw which I found for about 1/5 the price of an equivalent new one, however it needed some work. I spent a Saturday cleaning, oiling, calibrating, and building a new rip fence for it. I discoverd that a radial arm saw is really the way to go for precision cuts. Rather than moving a big block of heavy wood towards the blade, the heavy material stays in place while the blade runs along a track and makes a perfect precision cut. The end result is that the oak boards had a much smaller seam between the boards in the cabinet. I think this will help reduce board vibration as well as make it easier to seal.

I put about 2 pounds of a Dacron fiber called "Acousta-stuff". Supposedly it's better than Dacron fiber that one can get at a craft/fabric shop because the fibers are triangular rather than round..... Don't know about that, but the Loud speaker cookbook had some test results that said it was better, so I paid $8 per pound for this fluff. Fiber glass is suppose to be better, but for other reasons I decided I didn't want to use that. Dampening material is important for the speaker so as reduce standing waves in the enclosure which can mess with sound to the tune of a variable +/- 5dB! I just stapled this to the side of the walls excluding top and near the port tube.

I picked up a gold plated 8 post screw/banana speaker terminal which is intended for a dual voice coil subwoofer with individual crossover for each channel for hook up to additional speakers. Currently I use the active crossover from the subwoofer out in the Carver surround sound processor, so I've delayed on the passive crossover for now.

I have some small Polk speakers (4b?) I'm using as the satelite front channel speakers now. They have a 6.25" woofer. I don't have any performance spcse on these speakers.... so I'm guestimating by looking at other 6.25" of comparable quality that they will begin their roll off around 100Hz. I'm considering putting together a 2nd order low pass filter at 100Hz for the subwoofer. I had underestimated the cost for a crossover for this subwoofer. Doing some rough calculations for this low 100Hz filter looks like I'll need a 12mH inductor coil and ~200uF capacitor. Because of the high power nature of this subwoofer, I'm looking at $15-$30 for the inductor, and ~$50 for the capacitor.... Since this is a dual coil driver, everything will be mulitplied by two.

Amplifier Construction
I needed a mono amplifier to drive this subwoofer. While a cheap and easy way to do this would be to buy a bridgeable automobile amp, I had been looking for an excuse to build my own amplifier. Acoustic Labs has designed several high end amplifiers. Their designs are then marketed as "high end audio" project kits. Mark V Electronics, Inc. - Mark V Electronics, Inc. 8019 E. Slauson Ave. Montebello, CA 90640 Phone: 323-888-8988 http://www.markvelectronics.com/store E-mail: MARK5CO@aol.com http://www.markvelectronics.com -out of California markets. A mono amplifier(s) has a lot of uses in a component stereo system, especially in a 5.1 channel AC-3 or Dolby Pro Logic (THX) surround sound system that I can see using it for the forseeable future. As such, my thinking was... if I'm going to put all the time into making this, why not start with the best possible design. I decided on the AF-3 design which is a 300 Watt constant current MOSFET amp. MOSFET amps are known for having very similar characteristics to pentode vacume tubes without the drawbacks of being a vacume tube. The design has a built in speaker protection cicuit relay for protecting the speaker from power surge during power up. The design, PCB, mega heatsinks, and components that go on the PCB sell for $165. Not bad I thought... that is until I picked up everthing else I needed. The design calls for 4 filter 80-100 volt 10k uF capacitors which sell for about $25 each with mounting hardware. I picked up an 8 amp toroidal transformer (low hum, low EMF) for $66. Also I needed a cabinet of which I found a nice black anodized aluminum vented case with rack handles for $44. Other miscelaneous components such as an optional (quiet 23dB) fan, gold plated mega 4AWG capable speaker binding post, wire, rectifier bridge, fuse holder, switch, some extra capacitor and high wattage resistors, etc. brought the total price up to roughly $400 for this mono channel amp. Had I known this would be the price ahead of time, I probably wouldn't have done it. However, I now

rationalize that I've learned alot making it and that I have the best mono amp for my forseeable future needs.
I built two amps (Mom wanted one). Each amp took approximatly 50 hours assembly time. The end result is a nice sounding extremely powerful amp. 300 watts for this subwoofer is more than adequate. I have the subwoofer line out on the surround sound processor turned down to about as low as it will go. The subwoofer itself will handle 350 watts sustained, 500 watts peak. Watching the movie "Braveheart" during some of the battle scenes tends to set the whole house vibrating. One can feel the horses running across the wooden floors in the house.

After a couple weeks, I noticed the first amp I built would run much hotter than the other. I opened up the amp and recalibrated. There are two potentiometers that need to be adjusted. One is adjusted by reading the current to the amplifier board, the other is adjusted by zeroing the ouput voltage to the speaker when no input signal is present. I had adjusted these after assembling the amplifiers. However after running the amps for a while, one of the two potentiometers needed recalibrating. Now they seem to run at a reasonable temperature with my typical use.

I had picked up a 120 volt cooling fan at Radio Shack for cooling the amp. At the time, I didn't know how loud 38dB was which is what the fan noise was rated at. After trying it out, I decided this was too loud for an audio amplifier application. I found a 23dB fan + fan guard in a Jameco Electronics catalog. It's quiet enough, however, cutting the hole in the metal case has become a problem. I found a 3" circular saw, however this requires a drill press that one can set at 100rpm and can apply 150 lbs of pressure. I don't own a drill press, and haven't found one that can operate as slow as 100 rpms. I just finished a welding class, where in addition to stick welding, MIG and TIG, we learned to use a plasma cutter which is as easy as using an exacto knife. I think if a circular wood template was made ahead of time, the plasma cutter would be the easiest. I think the local welding shops rent a 110 volt plasma cutter for about $40. ...an expensive hole. I also needed to cut the case to install the oversized speaker binding posts. I used a coping saw for this. It was hard frustrating work and the results were not very nice. Fortunately, the cut is hidden by the speaker post mount, and so doesn't matter. A plasma cutter would have been great for this too.

Even though components in the amplifier would probably last longer running cooler, I've decided to wait on installing a fan until I have a better understanding of how hot it will run and can justify all the trouble of installing one. This also gives me more time to think up some way to wire up a thermostat controller.

=====================================

Re the anode voltage used for PA valves ; the older (1968-1973
generation) Yaesu transceivers (FT 40x & 50x)using TV Line Sweep valves
(tubes) had 2 HV voltage transformer taps resulting in either 650 or
850V-DC .
I always used 650V since 850V caused the valves to be too hot ,due to
the limited (1 small fan) cooling .
Although I have seen designs including 4 line sweep valves in
parallel,running on 1000 or even 1250 V ,but only with enhanced cooling.

When licenced in 1985 my first transceiver was a FT400 , an excellent
learning piece of kit,involving some 'fried' PA valves.

```

Hi all,
You may recall my note regarding the expected good results on low
spurs using the Analog Devices AD9912 1GHz DDS.
Well, my good friend Giuliano, I0CG, (of AD9951 DDS fame) has now
experimented enough with this new DDS chip and done some measurements
with interesting results.

His comments are:

"My laboratory tests demonstrate that spurious performance and frequency extension are superior to all others actual DDS, including the AD9951.
In a few words ... This new AD9912 DDS is the best solution available today for amateur radio applications"

You may visit his web site and see spectrum analyzer screen shots and comparison with his old AD9951 DDS design:

1) AD9912 with 190 MHz output (Clock 1 GHz)Analyzer span= 200 MHz

2) old AD9951 with158 MHz output (clock 500 MHz)Analyzer span= 200 MHz

3) AD9912 Frequency extension test: 400 MHz output (clock 1 GHz)Analyzer span= 500 MHz

http://it.geocities.com/giulianoi0cg/dds4.html

If you have problems to from the web page to be readdressed to his AD9951 DDS project you may try the following address:

http://www.radioamatore.it/i0cg/add9951.html

Giuliano is designing a new DDS PCB compatible with his actual AD9951 board as users of his DDS can easily upgrade to new performances for spurs but also extending the DDS use to VHF and UHF with better SFDR (HF, VHF and UHF VFO = 0-400 MHz with 1GHz clock or 0-480 MHz with 1.2 GHz clock).

Old and new projects can be easily updated to frequency and performances extension with better SFDR.

I0CG expect to have the new AD9912 PCB available during this coming September.

Thanks Giuliano for all your dedicated work on this important aspect of our radio technology.

I received both the boards I ordered from Mirrorbow in a few days and all my email enquiries were answered extremely quickly and thoroughly. I guess they are not a multinational, and Ive never had cause to ring them. However, payment is via Palpal which I believe offer a degree of protection anyway. My invoice on delivery had their address on it.

There are lots of companies online that dont show addresses or phone numbers online, so I cant believe it is illegal not listing them! Otherwise all those webspace providers would be breaking the rules!

I think its a silly to post a comment stating that they are not "bona-fide" unless you can post evidence to suggest this.

Twice I sent my money via paypal, and twice I received my board

quickly and it worked to spec. I had questions, and they were
answered on email.

If we expect every company we deal with as amatuer electronics
enthusiasts to have a call centre and list streams of directors I
think we would find them thin on the ground in our specialist area!

Oh, by the way, I found them through a magazine article written by a Davy Dick in a publication called MERG. Which is a model railway magazine (don't ask!). He's a railway enthusiast and the article was about using the board for controlling model railways, I don't think he has any association with the company.

The evidence is their web site which does not comply with UK law as to revealing the business address and names of directors.

In the amplifier compartment of a 1970s vintage ham radio, if the plate choke in the B+ supply lost some of it's inductance due to some of the coil windings shorting together would it cause the plate tuning capacitor to require less capacitance (such as fully open) to reach resonance?

-Curios.

<snip>

Although very incomplete and of low visual resolution, schematics and cabling information for the V1's radio are at:

http://www.zenza.se/vw/v1_radio.html

Its power oscillator, running with 1kV on the plate, is at:

http://www.zenza.se/vw/gh%20bilder/gh512a_b.jpg

It appears to use interelectrode and stray capacitance to
resonate the tank; no component values are given ;(

Double-posted to rec.radio.amateur.homebrew and r.r.a.boatanchors

Tubes in their original boxes are easy to store; just line them up on
little shelves which have enough "lip" to keep them from falling off.
But what about tubes which are NOT in individual boxes? I currently
have boxes and boxes (shoe-box size boxes) of loose tubes (mostly 7-
and 9-pin and octal bases; plus a few bigger ones, such as 807/1625,
1619, etc.) Has anyone found a really-good way to store loose tubes?

I've considered making some flat shelves (with enough "lip" ...) and
just laying the tubes down horizontally side by side. I've also drilled
some tube-base-diameter holes in a piece of 2x2 (actually 1.5x1.5) so
they'll stand on end; looks nice and would be easy to mount as shelves,
but will probably cost a fortune in spade drill bits!

Any suggestions?

How about some 1/2 or 3/4 inch pink insulation "styrofoam" board? Cut
it to fit on top of a shelf. Maybe drill a hole for the tube's plastic
center indexing post (if it has one) and let the actual pins poke into

the styrofoam to hold the tube to it...

Egg cartons? Cut a tube side hole in the top. In my location, they are
now using plastic ones rather than the old pressed paper ones.

Buy replacement boxes! Antique Electronics Supply stocks them, so do a
lot of hamfest tube dealers. They aren't expensive.

I'll add that either Antique or Angela Instruments have boxes galore.
Also, Antique and other have a egg-crate type dividers especially for
various tube sizes. I just bought several hundred boxes from Angela
with the Westinghouse logo. They're cheap if you can live with the
logo!!!! hi!!   de Jeep/K3HVG

Do you have a web link to information on this requirement?  I'm
curious.

How do businesses operate that are partnerships or sole traders?  It
is not a requirement for a business in the UK to have directors, so
how can they all be required to show them.  You're suggesting you have
to be a limited company (they have directors) to trade on the net....

I didnt imagine putting this very helpful company in my post was going
to create so many problems and I feel a bit guilty now!
I found this on the web:
****
According to Outlaw, the following is the minimum information that
must be on any company's website.

    * The name, geographic address and email address of the service
provider. The name of the organisation with which the customer is
contracting must be given. This might differ from the trading name.
Any such difference should be explained ??? e.g. "XYZ.com is the
trading name of XYZ Enterprises Limited."

      It is not sufficient to include a 'contact us' form without also
providing an email address and geographic address somewhere easily
accessible on the site. A PO Box is unlikely to suffice as a
geographic address; but a registered office address would. If the
business is a company, the registered office address must be
included.
****

I sent it to mirrorbow and they said they would put an address up on
the contact page http://www.mirrorbow.com/contact.htm so it should be
there by the time people read this. The company is privately owned
and does not have directors apparently, and they said that they didnt
post an address as they do not have the facilities to receive
customers.

I would recommend you email the mirrorbow guys and ask you're
technical questions before ordering. I was impressed by the friendly
help I received.

Yes - I'm not aware of any equivalent regulations apply to sole
traders or partnerships (other than limited liability partnerships -
LLPs).

Well I've started another discussion group for the National HRO Receiver. I
couldn't find a group that dealt with this particular radio. So if you own
an HRO or are just interested in them, why not join.

If these are random used/unknown tubes of no particular value, the economical solution is to toss them in shoeboxes or larger boxes and not do anything to protect them. It's questional economics to keep them lying around for another 20 or 30 or 40 or 50 more years!

If these are known good tubes with some value above zero, cardboard boxes for all the common tube sizes (in particular the sizes you mention) are available from AES, Angela, etc.

If you are a distributor with thousands and thousands of tubes coming in from the far east or Russia, eggcrate-divider packing is popular.

Tim.

Hi,
I am looking for a copy of a construction article on a single compactron FM
receiver. The article appeared in an 1961 issue of Popular Electronics.
If anyone has the issue and would copy the article for me I would pay them
for their trouble.
Richard

This is very strange... less inductance in the plate choke implies
less inductive reactance, thus needing a lower capacitive reactance
(MORE capacitance) in the "plate" capacitor.
Does the Tx perform well otherwise?. Or maybe you are fooled into
thinking you've found resonance, but it is at an harmonic or spurious
oscillation?.
If you've not done it yet, better replace that choke. Shorted turns
mean not only less inductance but also degrade the quality factor, may
introduce a significant power loss (and overheat too).
By the way, 2.5 mH is a common value, but 1 mH or less may be more
than adequate even for 80 m, and with less spurious resonances above
that. It is even better if honey-comb wound (less self capacitance) or
split in sections.

Interesting about 'Inverter' power supplies in domestic microwave
ovens.
Here in this part of Canada have never knowingly seen one that was not
115 volt AC input.
I guess one could call them 'Switching power supplies'?
Our appliances have therefore been pretty heavy and usually with the
transformer mounted inside towards one end.
Several owned and subsequently a number scrapped have all had 60 cycle
transformers.
Have read that the transformers go into saturation each half cycle?
It appears that one end of the HV secondary of the transformers is
often grounded to the frame of the transformer.
However often thought that the substantial 60 Hz. transformers would
be the basis for good (non portable) PA power supplies.

A ground secondary would mean a half-wave rectifier, which would
place a heavy DC bias on the core and might lead to core saturation long
before the full capacity of the transformer is reached..
Hammond derates their transformers by .28 for halfwave rectification
with capacitor input filtering. I think the current is also limited
by a magnetic shunt on the core (removeable, I think..)

If these new inverter supplies use a higher frequency and smaller
toroidal type core, that might open the possibility for easier
mods for ham use. I'd think it would have been featured in one
of the more technical ham magazines by now, though..

Pete

Just an estimate...

I think the plate choke is effectively in parallel with
the plate tuning inductor. But, I suspect ratios between
the two inductances would preclude much interaction
unless there was a major loss failure in the choke.

I'd be more worried about parallel resonances in the
choke falling within the operating bands the amp covers.

"AS IS" the inverter supplies are not suitable for ham use unless you want
to do some EME work on 2.4Ghz. Probably why you havent seen anything about
them. I was just hoping to learn enough about them to make some power
supplies are are usable must like several people have modified the 60 cycle
transformers for various uses.

A couple of shorted turns would efect the inductnace of the coil a lot more than you are probably thinking. My guess is that you are just aking how a relatively small change inductance would effect the circuit and the answer is none.

Public library has these on micro fiche. I noticed recently that they are
changing over to CD. I guess someone cold go in with a lap top and copy
watever they wanted.

-Carry Handgun (CCH) license

I used to use cigar boxes. I told the guys at the local drug store to save them for me.
I would sort the tubes and if I had enough of one kind I would dedicate a whole box to it and sometimes I would make dividers.
I know hey have stuff down at he Walmart better than this now..

Why is that? Did you find some specifics on the design that would preclude
something like adding filtering to the output to provide a filtered DC
voltage?

Pete

Do you mean removing the guts and replacing tubes with with modern solid
state parts or do you mean somehow replacing entire radio with an Alpine
or Pioneer or something that will fit in the hole in the dash?

Do you remember or did you see the "high end" VHF receiver construction
article that Popular Electronics ran a few years later?

I think it was sort of modularized, so there was a tuneable or more
likely fixed IF section, and then converters for the low band and the
high band and maybe the aero band. It wasn't that spectacular a receiver,
it might have had a tuneable local oscillator going into the first mixer
and certainly the only selectivity came from IF transformers in the
MHz range. But it certainly was more complicated than the run of
the mill "police band" receiver construction articles that were
described in the hobby electronic magazines.

Hi Michael

Probably not, as I was a young teen and picked up what I could afford
at the local newstand. I guess the issue with that earlier compactron
project was one of the ones I happened to buy.  Sad to say, a Heath
VF-1 provided the enclosure!

I noticed that you do not mention any sort of shielding or shielded
room for this plasma driver. Given that situation, it would probably
not be in the best interest of this group to help you build a high

power oscillator with limited frequency stability and the possibility of gross amounts of RF escaping into the ether to interfere with other licensed and unlicensed users of radio spectrum, including ham radio operators.

Having said that...there were Radio Diathermy devices made in the 1930s & 1940s era that were simply free running power oscillators, much like what you are talking about. These old-design devices are now illegal to operate in most countries. Similar designs are still used for welding plastic assemblies, but these are required to operate inside a shielded enclosure or in a totally shielded room.

To make something like this you would probably want to start with a conventional VFO (Variable Frequency Oscillator) of the Hartley type, then scale it up to run at the power level you want. However, in order to not run afoul of the law, you might want to build a very stable crystal controlled oscillator and driver section that would then drive your power amplifier. There are specific frequencies that are allocated for use by "incidental radiators" that are part of industrial equipment. Check with your country's radio spectrum regulating authority to find out what the legal operating parameters are for your country & locality.

Hi,
I am looking for some plans for a simple(beginners) 20 Meter SSB Tube
Transceiver and was wondering if somebody had any good plans or web
site they could point me to?

Any help would be greatly Appreciated
Thank You

Have a look at the Heathkit HW32 cct, http://bama.sbc.edu/heath.htm .
should give you a few ideas.

Anode choke is about 1.3mH, but its not mounted away, its pretty close, about 2 inches, although its in the opposite plane to the tank coil. Is that OK?

As for driving with a fixed generator first, it would be a good thing to try I must admit - but its a big effort. I have no geny that will go to 25MHz and to make one capable of providing the 20 watts or so I would need would put me considerably back - I know shooting straight for the goal in a case like this is harder of course, but seeing as I have the thing running already at low power, I am hoping still...

As for the 'two grids' this seems to be bad documenting (the original russian docs I think). There is definatly one grid - the tube has a single grid between a pair of connections for the heater, one of which is commoned with the cathode, and also a plate connection of course (the heatsink). The docs showing 2 grids confused me but I assume that its just that they couldent be bothered to redraw the picture! As I say, theres simply not enough connections... Unless theres something I dont know about here?

Re is it buzzing at UHF and I simply cant see it I did wonder that
too. But I guessed that there would probably be signs, like more heat
in certain caps, and corona and such. But I cant discount it. I guess
I could test this with a filament lamp indicator or similar.

And as for ARVs concerns, quite right to inquire. The test design is
currently as screened as is practical, mostly boxed in an aluminium
box, but the base is off, which is where the grid circuitry is. I
think that at this level, there is negligable radiation from this side
of the circuit, but at the desired power, maybe there would be some.
However the base will be on as soon as I have it working properly, as
much for the sensitive electronics I have in the workshop as for
reduction of spurious emissions. The several computers I have have
demonstrated their sensitivity to RF at a low power level by all
deciding to wipe their hard disks when I used a new HF striking TIG
welder a while ago - a sad incident as I am sure anyone who has gone
through the same thing will agree.

When in final use, the output will be capacitvley coupled to a quartz
glass tube that passes through the aluminium case. Gasses at low
pressure will pass through this, be excited by the discharge and will
glow, and this glow is viewed through a wire mesh screen for
spectrographic uses.

I may need to add a second outer case depending - I am unsure yet
whether induced currents in the case will reradiate a significant
amount of RF or not, so we will have to wait and see.

As you say, one option would be to fix the frequency and then tune
with a cap - the main reason I dident shoot straight for that is that
in the UK you cant radiate anything at all, so irrespective of my
chosen frequency, I have to screen to a high degree of attenuation.
And now that I am begining to think that I need to include a variable
cap to tune the grid circuit to the tank (this is my latest hypothesis
why I am not getting the power I need), there seems to be no
disadvantage to fixing the frequency. So we will see.

Could anyone comment on that idea by the way? That perhaps, the
capacitance between the grid and plate or cathode is resonating with
the feedback coil, but is tuned to a different frequency to the main
tank, and so limiting my drive? I did wonder about changing the Q of
the tank to make the amp more broadband, which I think would reduce
the impact of such a difference in frequency. Also I could try adding
a tuning cap to the grid coil to tune it to the tank coil maybe.

This might make a good contest: coming up with an SSB transceiver that
is capable of making real contacts on the air with a minimum number of
tubes. The IF and Xtal filter could be make bilateral for RX and TX, and
maybe using diode mixers (for the PD and TX mixer) might also allow
some bilateral shared stages in those areas as well. Even the TX predriver
could be switched for the RX RFA with some effort. I wonder how few
tubes it would take to make a 5-watt QRP xcvr for 20 meters? The
receiver doesn't have to be overly complex. A basic direct conversion
receiver could serve as the entire IF and detector, with the xtal filter in
front for single signal reception.

i have found that they are regulated and variable to some degree via pwm Old stle microwaves varied power by varying the duty cycle that the tube was on over a period of seconds. that is to say if a 705 power was set the tube would be on full power for 7 seconds out of 10. the inverter style actually decreases the voltage to the tube. interesting possibilites about for amplifiers

Why not re-work a 10 Meter(CB) SSB), Re-Tune the Rx. Front-end for 20
Meters, Use the 10 meter Tx as an Exciter to drive a 20 Meter Final.

This way 85% of the design work has already been done and tested !

Are you out to prove a point, or want a working rig ?? Tubes have been
obsolete for fifty years !! Why else would you attempt to build a
Sideband rig using parts that have been out of production for several
generations. If you are going to wind coils and Rf transformers why not
wind them for transistor stages. Transistor Rigs (CB) are CHEAP. Tube
type rigs have long been relegated to the Scrap Heap.

What's wrong with building a tube radio??  Tubes are actually more
available now then they were twenty years ago.  There are thousands
of tube rigs still in daily use.  There are several companies that
deal exclusively in vintage electronics.  It's a hobby, and if someone
enjoys vintage technologies, so be it. I enjoy the best of both worlds.

BTW, have you priced a Hallicrafter SX-88 or 115 lately?  A decent
Collins R390??  Heck, many transistors are becoming just as obsolete.
State of the art is DSP and software defined radios these days.

The ARRL published a series of small books on SSB(receivers, transmitters,
xcvrs, amps, and theory) between the 50's and the 70's. I have two of the
series that I use as reference material. One of the articles was a 3-tube
transmitter for 20M. There are several other interesting projects that might fit your
requirements.

One additional pointer... the Bill Orr Radio Handbook (exact edition unknown,
but the cover was bright red!) had a monoband transceiver project that was a very
neat, simple, and well designed transceiver. It had many features in common with
the Swan transceivers of the 60's and 70's....

Wish I could be of more exact help, but I've passed on most of the older books
to make room for antenna tubing in the shop.

Good luck with your projects.

Mind Control and Directed Energy Weapons

Do you know Mind Control Weapons and Brain Washing (such as CIA Mind Control Project : MKULTRA) ? Do you know voice can be transmitted to human's head from long distance(V2K)? (In 2002, the Air Force Research Laboratory patented precisely such a technology: using microwaves to send words into someone's head.)Do you know Directed Energy Weapons(such as: Electromagnetic weapons) and Non-lethal Weapons? Do you know that people's thoughts can be read now? Do you know Nano technology weapons (such as British MI5 Nano technology spy weapons which can control little spy mice from long distance)?

Such kinds of weapons have already been used covertly to torture and harass innocent, legal, unarmed and defenseless civilians for many years all over the world.

There are more than 1500 people who are suffering terribly from mind control and electromagnetic weapons torturing and harassment. Some victims were only 21-22 years old when the first time they were seriously tortured and harassed.

Have you ever imagined that there even was not one happy and peace day in the life, but only suffering for 5,10 or 20 years? Yes! Some victims died, but at the last minutes in their lives, the only thing belongs to them was still suffering.

Please come to help us by signing your support to stop these kinds of weapons torturing and harassing lawful citizens. Our goals:

(1) We wish a resolution from United Nations to stop Mind Control and Directed Energy weapons torturing and harassing. (2) We wish all government cooperate together to sentence those torturers according to

law.

> some bilateral shared stages in those areas as well. Even the TX predriver could be switched for the RX RFA with some effort. I wonder how few tubes it would take to make a 5-watt QRP xcvr for 20 meters? The receiver doesn't have to be overly complex. A basic direct conversion receiver could serve as the entire IF and detector, with the xtal filter in front for single signal reception.
>
> Pete k1zjh

Somebody already suggested the "Imp" that was in one of the later ARRL SSB manuals (and the same author came up with a solid state version later), and presumably had appeared in QST before that.

A different way of dual use, without the bilateral stages, is to have a balanced mixer, the filter, IF strip, and then a balanced mixer. By using broadband mixers, the first stage is either the receiver mixer, or the balanced modulator for the transmitter. Then the balanced mixer at the output of the IF stage is the product detector on receive, and the conversion mixer on the transmit. The signals all go down the strip in the same direction, and relatively little switching is needed.

One of those ARRL SSB manuals had such a transceiver, nice and small, albeit with transistors.

Though, I seem to recall there was a transceiver made out of subminiature tubes in the late fifties or early sixties. Unless I'm confusing it with something else, it was in the Bill Orr Handbook.

THat's a bit of a stretch, fifty years ago transistors were hardly capable
of replacing tubes. Yes, there was solid state equipment coming off
the line by 1957, but much of it wasn't particularly great, designers
not having figured out how to make good transistor equipment.

Even forty years ago, tubes were still going strong.

Now if you'd said tubes were obsolete thirty years ago, that's far
more likely to get agreement. By then solid state had risen
sufficiently that no new tube based equipment was being introduced
(well, the exception being the output stage or stages).

There is all kinds of old parts lying around, waiting for that
day when someone would finally build that "dream rig". Of course
nodoby is going to be able to buy tube type components at their
local parts emporium, even if the local parts emporium still
exists), but then even forty or fifty years ago those who
had to buy off the shelf just like in the magazine article
often suffered, since they had to rely on what the magazine
article said and had to rely on what they could get at the
store.

But anyone who shows a certain level of capability can scrounge
parts and make do with what they can find, so it's not particularly
that big a deal that someone wants to build with tubes. IN a lot
of cases, the parts are just waiting to be used, since others
have declared them "obsolete".

It's kind of interesting that you dismiss building with tubes,
but then turn around and suggest the solution is to modify a
CB rig. Not that there's anything wrong with that, but someone
wouldn't be building in the first place if the "wanted something
already tested".

I can't give any specific advice about the USB interface, but I recall that
there was a PC based spectrum analyser published in QEX within the last
couple of years.

If you don't already, I would recommend subscribing to QEX, it's published
quarterly by the ARRL. It contains a lot of leading edge technology. A
Google search will give you more details.

As long as the mH choke is mounted at 90 degrees from either of the other inductors, you should be OK.

I am trying to think of ways to move you away from you current stalemate, hence the suggestion about using an Xtal osc for drive. Do you have access to a CB rig, ham rig, something that you can derive a few watts drive from, just to see if the unit is tuning as expected ?

I am quite intrigued about your 12V supply and diode to the Grid. It looks like the 33k should normally be at 0v and any -ve RF excursions are clamped at -12v, is that correct/what you intend ? Might be worth sticking a 100uA meter between the 33k and ground to allow you to check for grid current.

I do like the idea from one of the other contributors to check for jumps and hysteresis as you are cranking up Va while monitoring Ia. The two should move smoothly together, jumps are a possible indicator of instability.

I think 13.56Mhz may be the ISM band of choice if it is available in the UK, why did you choose 25Mhz initially ?

Any chance of pictures of the current hook up ?

Have you considered grounded grid ? the cathode coupling loop might only need one turn.

Is this a college/uni project ?

Regards,

Mark

> As for driving with a fixed generator first, it would be a good thing to try I must admit - but its a big effort. I have no geny that will go to 25MHz and to make one capable of providing the 20 watts or so I would need would put me considerably back - I know shooting straight for the goal in a case like this is harder of course, but seeing as I have the thing running already at low power, I am hoping still...
>
> As for the 'two grids' this seems to be bad documenting (the original russian docs I think). There is definatly one grid - the tube has a single grid between a pair of connections for the heater, one of which is commoned with the cathode, and also a plate connection of course (the heatsink). The docs showing 2 grids confused me but I assume that its just that they couldent be bothered to redraw the picture! As I say, theres simply not enough connections... Unless theres something I dont know about here?
>
> Re is it buzzing at UHF and I simply cant see it I did wonder that too. But I guessed that there would probably be signs, like more heat in certain caps, and corona and such. But I cant discount it. I guess I could test this with a filament lamp indicator or similar.
>
> And as for ARVs concerns, quite right to inquire. The test design is currently as screened as is practical, mostly boxed in an aluminium box, but the base is off, which is where the grid circuitry is. I think that at this level, there is negligable radiation from this side of the circuit, but at the desired power, maybe there would be some. However the base will be on as soon as I have it working properly, as much for the sensitive electronics I have in the workshop as for reduction of spurious emissions. The several computers I have have demonstrated their sensitivity to RF at a low power level by all

Ive done a little with USB, so I'll add a little background if not provide complete answers.

The first hurdle is the interfacing. You need a board with a driver thats easy to interface with your host PC software program.
Ive used a board from www.mirrorbow.com for general control...you can access it every 1mS and get 12 x 12bit ADC samples for each access, or you can alter 8 bit digital ports etc. However, the speed is limited to how fast the operating system can access the board, which is 1mS.
This board pretends to be a com port so it makes programming easier without needing to include libraries and dlls etc.

Theres a board from National Instruments which I think is faster,
though only around 2.8Msamples/sec http://sine.ni.com/nips/cds/view/p/lang/en/nid/202596
And of course there are some dedicated USB spectrum analyser
available, but thats not the same as doing a home version.
So, you could just get a DAC board and go for it, though the speed you
can make a spectrum analyser is limited.

Of course you could use the superhet principle with a narrow band
filter and a programmable LO. You could then use a simple IO board
like the one from Mirrorbow to setup the LO, then use a peak detector
and the boards AD to give an indication of level. You'd then have a
digitally controlled analogue spectrum analyser, and you woudlnt need
the large sample rate.

Well, why don't you e-mail them and tell them what you read in your £350 law book. There are two e-mail addresses on their website. I'm sure they'd be delighted to hear from you as much as we are.

Better still, GET A JOB.

The state of USB has improved pretty dramatically in the past couple of years. The QEX article was a groundbreaker at the time, but the technology has moved on.

Presumably you are aware that a USB interface implies computation on both sides. The relatively recent USB PICs (18F2550, 4550, etc.) incorporate everything needed for the USB interface except the connector. Only a couple of years ago a USB controller chip was $26 and it needed a host of additional parts to actually implement the interface. A smaller USB PIC costs less than $5 and includes *everything*.

Go to http://ww1.microchip.com/downloads/en/DeviceDoc/39632D.pdf and take a look at the capabilities. To see it in an actual circuit, try
http://www.microchip.com/stellent/idcplg?
IdcService=SS_GET_PAGE&nodeId=1406&dDocName=en529760
and download the users guide. The 2550 is the little TQFP to the right of the board picture, although it is available in a variety of packages, some more hobbyist-friendly then the tiny one on the board. The only additional part is an inductor to filter the USB voltage when it is used to power the target circuit.

This series of parts also includes A/D channels, tho they might not be the speed and resolution you want. The particular board is a nice one for experimenting because it includes one of the fast 16-bit parts that are easily programmable in a high level language, along with the USB interface.

Yes, it was more common to see separates. ON the other hand, when there were actual transceivers described, they did tend to use common circuitry between transmit and receive. Solid state, because of their size and low cost, has made it pretty easy to build complete separates (minus the oscillators) in one box, which of course does have the advantage of making switching pretty easy.

One advantage of separates is that it looks less daunting. Build the receiver, and you have something finished, and even have it for testing the transmitter. Then build the transmitter. The overall product may require more work, but at least it's broken down into more manageable pieces.

> Othere QST articles QST April 1961, A 75M SSB tranceiver.
>
>
> I'd bet back issue reprints of QST articles are available from ARRL..
>

Traditionally, and I'm not sure why it would have changed, you could get back issues for a reasonable fee, and if they didn't have any of that issue, the specific article for a reasonable fee.

Of course, one can also get back issues on CDROM, and for someone interested in the tube era, it might make sense to get a set from the era when tubes were still pretty common in QST, but late enough that things had developed well.

Old Handbooks of course not only have the construction articles, but the peripheral information that might be needed by someone starting to build tube equipment at this point. That 75metre SSB transceiver that you mention, it showed up in a number of Handbooks in the early seventies, and yes, it sure looked neat for an 11 year with his first Handbook in 1971.

Many thnaks for the heads-up on the PICs. I've always tried to avoid USB
interfaces for control applications, but I have a project on the horizon
where I will almost certainly go down that route - simply because laptops no
longer have RS-232 ports..

If this is a one-off project, you might even consider that particular board, depending on your requirements. The USB is used as a peripheral to the 28 pin part, so that from the bigger part you can simply do a printf() to communicate to your PC over serial. It relies on a Microcoft provided serial emulation driver. If your requirements are more demaiding, then you will need to really hit the books. Doing the USB software interface isn't real trivial.

mmmm ... I can see I should have been more explicit there, and maybe caught a couple of typos.

There are a number of USB classes with different capabilities. There is a serial emulation class, which Microsoft provides a driver for. It appears on Windows as a new serial port, and applications access it as if it were a serial port.

All USB devices must offer up a manufacturer code and a device code whenever they are first connected. The OS reads a .inf file to connect the particular codes to a driver. MicroCHIP provides an .inf file with the board that points to a MicroSOFT driver which does serial emulation.

When the 16-bit part wiggles it's USART, the PIC18F2550 catches that and sends it out over USB to the PC in serial emulation mode. The application on the 16 bit part must set up the baud rate for the USART, but beyond that, normal C I/O can be used, although it is pretty fat for many applications.

The documentation for the board says in comes with a dsPIC33FJ12GP202 but mine came with a PIC24FJ64GA002 -- more memory but no DSP engine. The board has jumpers to accept any 28 pin, 16 bit part. I've been doing most of my experimentation with a dsPIC30F012. The 30F parts are 5 volts, the others 3.3, and the 30Fs have a slightly different pinout. Jumpers deal with both, as well as deciding whether the board wants to be powered from the USB or a separate supply.

For a lower cost implementation, the 18F2550 and its cousins have plenty of gas to do more work, and Microchip does provide sample code for the USB serial interface, but I've always been a bit suspicious of Microchip sample code ... often it isn't quite as solid as one would hope.

NOPE, that is urban legend BS or must be working for a Far East exporter (Purpose of the "weak dollar" is to strengthen these mfg. in world market - not kill them).

Just in greater Chicago area there are at least 3 major mfg. that have been around for 75+ years -- and turning out hundreds a day plus custom requests. Triode Electronics JUST handles the Dynaco rebuild requests -- they are providing brand new units exceeding original 1950 specifications (better materials and mfg facilities)
http://www.triodeelectronics.com/

Heyboer - Grand Rapids, MI
http://www.heyboertransformers.com/index.shtml

Heyboer also handles the profesional musicians/bands/professional restorers/audiphile market -- that still use vacuum tubes for that soft warm sound!
http://www.heyboertransformers.com/tubeamps.shtml

There are a LARGE number of US transformer manufacturers -- USE the GOOGLE with the Internet!!

> If you can find an old Heathkit HW32 (Monobander SSB series) and
> rebuild it that might work better.

Yes, that is a viable solution for a tube based radio. A solid state design is also possible.

Does anybody have a good copy of Lloyd's VLF receiver as in
http://www.qsl.net/vk5br/VLFLFRx.htm
or know of a better link ..?
The schematic is of such low resolution that's impossible
to distinguish component values.

Thanks, Andrew.

I did that with a small solid state transceiver for 160 and 80 meters. The
mixers were DBMs. I think I wrote up the bilateral IF for Ham Radio,
but never got around to publishing the entire project..

> One of those ARRL SSB manuals had such a transceiver, nice and small,

I think that may have been the rig by Benjamin Vester (if my memory hasn't
messed up his name!) That was a cute project that always fascinated me.
At the time I was in my early teens and didn't have the skills to duplicate
it. Late 50s or early 60s IIRC.

That's it. It's in both the fourth and fifth editions of the SSB Manual. Looking now, I see that it is listed as originally in QST for June 1959, which seems terribly early. It looks like something that would have been published in the mid-sixties.

What's surprising is how small it is. That sort of construction is hard in itself, but at a time when people were still just getting close to transistors it becomes amazing.

I was vague about that because I'm not sure what I'm remembering. There was an article in CQ about the "Argonaut", I think in the early sixties but maybe late fifties, about this miniature SSB transmitter or transceiver, and the DXpedition it went on (so maybe it was just a transmitter, to get some new countries on the air on SSB, where there'd already be receivers). It wasn't a construction article, but the intro mentioned the consctruction details were published elsewhere. Either in the Bill Orr Handbook, or the "Editors and Engineers" SSB handbook (which were either Howard W. Sams, or would a tad later be engulfed by Sams).

But I'm not sure if that had subminiature tubes or not. Thinking about it now, such a rig seems vaguely familiar, so maybe I did see the book it was in at the Library in the early seventies when I started reading such things. THere definitely is some memory that is stronger than that CQ article, but I don't know what.

This may be a daft question, but is Marketing name for the product "Inverter" ?

Doing a quick search on eBay, several ovens pop up with this name, one description was "Panasonic Inverter Microwave Oven 1100W" - looks like a 110V product to me.

I have never heard of a 12 or 24v microwave oven, 1100W at 24v = 45 amps which seems excessive even as a load for a large truck.

Regards,

Mark

7 seconds On and 3 seconds Off for a 1000w oven is an average power of
700w, assuming your chicken will integrate the power (as all good
chickens probably will :)

Conventional microwaves control the power by ON/OFF cycling of
the oven. For example, 1/2 power might be 5 seconds on, 5 seconds off.
The inverter technology controls the actual klystron operating voltage
to set the power level, and the food is heated continously. I'd suspect
the variable power feature has horrendous artifacts on the supply
voltage making it completely unsuitable for use by hams.

In the vacuum tube world,
several types of TV line finals
are reused as HF PA FINALS.

-       WHAT ABOUT CRT-TYPE PC MONITORS?   -

Are there solid state components there
that could do say 5 to 30W (in) at HF?

Any other components
that would fit well
in a basic CW TX?

I'd be moderately surprised if that were not the case!

Hints, anyone?

Filippo

I think if you do some serious searching you find there are literally
HUNDREDS of
simple kits available for any ham who wants to build his own equipment. From
sophisticated transcievers to tiny TunaTins, PSK-31 transmitters, and
a few simple software defined
rigs thrown in for good measure. I don't see the need for what you're
proposing, and the market would have filled the gap if anyone else did.

Pete

I think you'll find the big power transistors are the horizontal output transistors, and they have very limited frequency response. Barely up into the HF range. Not really a surprise, given they are intended for tens of KHz useage, and nothing more. They may also have extraneous components built in, that may get in the way of other useage. And there may be limits on their useage in non-pulse applications, just as sweep tubes from years ago had limitations in linear use.

Any other power transistors may also be limited in frequency. On the other hand, other than the horizontal output transistor there isn't really anything special about the power transistors in a monitor. I suspect your chance of finding suitable transistors are just as good in any piece of consumer electronics that would have power transistors. So it's more a case of looking in those scrap printers and those switching supplies and even audio amplifiers, and looking up the power transistors in the databooks to see if they have any good frequency specs.

In the old days, tv sets were one of the few consumer electronic equipment around, those and radios. So if you wanted to scrounge parts, you had to go for tvs and radios. The former, if they had an actual transformer in the power supply, could supply a nice hefty transformer and that was likely a bigger key component than the tubes.

Now, there is an awful lot more consumer electronics out there, in quantity and variety. And of course, it gets scrapped. So there is a lot more chance to find parts of the common variety. There was nothing all that unique about tv sets, other than they were available.

Of course, sweep tubes were used in commercial ham equipment because they were cheap because they were used in a lot of tv sets. So long as transistors aren't exotic, they tend to be far cheaper than tubes were, and buying them is as easy and cheap as trying to find suitable HF transistors in consumer electronics.

> Any other components
> that would fit well
> in a basic CW TX?
>

Any consumer electronics will supply lots of capacitors and resistors and garden variety small signal transistors. They may supply some power transistors suitable for transmitting, but that would depend on what is used. Some consumer electronics will still have transformers, and those are worth grabbing. Filter capacitors for the power supply. A lot will supply various crystals and/or crystal oscillators, though chances are good their frequencies won't be in an actual ham band. Of course, find enough crystals on the same frequency and you can start making ladder filters. Lots of LEDs, and various switches (though pushbottons are more common in some areas than toggle switches). Pull a VCR or tv set, and you'll find tuner modules that may be useful in other things. Any old am/fm radio will have a multi section variable capacitor, just like the old days, though likely the newer the radio the more likely they use varactors instead. All the audio amplifier ICs you can want, be they in radios or on soundcards or modem cars. It just goes on.

But other than the variable capacitors, few of the parts will be especially exotic. If you need really high frequency transistors, you'll have to look for things like satellite tv receivers. Though, I once got some Mosfets out of FM preamps for car radios. The average am/fm radio will supply ceramic filters, "narrow" at 455KHz, wide at 10.7MHz. Find the legendary ssb CB sets in the garbage, and that should supply a decent filter for SSB, but otherwise you aren't likely to find narrow filters in consumer electronics. Cellphones, the older and clunkier the better since they will have useable components, are a treasure trove of parts, including roofing filters in the range above 30MHz, and usually a 455KHz narrowband FM IF strip, complete with a crystal to move from the roofing filter frequency down to 455KHz. But those narrow filters will still be too wide for even AM. Cordless phones offer up 10.7MHz and 455KHz ceramic filters for FM use, and again the needed crystal to get from one IF to the other. You can often extract the IF strip as a module and use it intact. They often use identifiable Motorola FM IF strips, that can be reused in some other uses. At the very least, they are a source of "gilbert cell" type mixers.

In the old days, if you wanted exotic components, you had to go for surplus. Because no consumer electronics would have those needed SSB filters, or even crystals to make your own filters. That's changed, a lot more variety is available in consumer equipment.

But likely no matter what you are building, unless it's relatively simple, you will always find some component that you can't scrounge.

yes, there are appaently 2 types, one is made to run off of 12 volts maybe
24 VDC and the other runs off of 120VAC.
I think the 120VAC initially converts it to 300VDC then aplies it to the
inverter circuit.. Still trying to find a schematic to verify. I would think
this technology could be a major help for amp builders allowing us to build
inexpensive power supplies and easily custom wind the inverter transformers.

Why don't you try one and let us know? It might just need additional
filtering
if they are using some sort of pulse width control of the klystron duty
cycle.
I was just expressing an opinion. My kitchen microwave is a Panasonic
inverter type.

Pete

check the video finals, usually they can
supply a few watts in the HF range :)

Hi. I'm sorry if this is off topic here but I thought some of you would know.

I'm looking for a small portable battery operated AM/FM radio to bring with me on hunting/fishing trips, so I guess what I'm looking for is a radios with a strong receiver to catch as many station as possible. I'm not looking for better sound, just a basic radio   I know any radio won't work if you are too far away, but that won't be my case. with the radio I have now , I can catch like 1 FM station whenb weather permits, and 4 or 5 AM stations,... I would like to increase these numbers as much as possible..

Can you recommend a good brand/model please?

regards
stef, Montreal, Canada.

Please dig out the ones you have and take photos, front and rear of the
entire unit and if you don't mind, disassemble and photograph and
components. I can host the photos if you wish (email them to me).
This would _really_ help in the evaluation until any of us find schematics.

Regards,

Michael

Somehow I seem to remember an early commercial 'radio oven' that used
a klystron; can anyone confirm this?

> I was just expressing an opinion. My kitchen microwave is a Panasonic
> inverter type.

Please post photos of it together with make and model info; if you feel frisky, photos of the interior and PCBs would also be helpful together with a photo of the wiring-diagram label that is often included.

Regards,

Michael

When it croaks. My wife likes it in one piece for now. Magnetron,
not klystron... Typo.

Pete

Thanks Everyone,
I'm not new to working with tubes just putting something together this
size is a bit daunting...
Tubes and crystals are not a problem either,I have plenty of both.

I'll look over all of your posts a bit closer and see what I can work
out.

I Appreciate the help Guys
Thank You

Wish i could, i dont even have one of them now. wife said i couldnt tear
them up and donated one to a church and we are using the other. i noticed i
can get the service manual for a few bucks and will probably do that, i was
hoping i could find one for free. Sometimes sevice manuals dont go into that
much detail. though.

An article with some graphs showing the inductance and Q of coils
which were wound on commonly-available bolts is at

  http://www.radagast.org/~dplatt/hamradio/self-supported-coils.pdf

Don't know if it'll help, but here are 2 Kepco power supply schematics
we have here:

http://www.talonix.com/images/kepco1.pdf

http://www.talonix.com/images/kepco2.pdf

Brian-Thanks for the links... the first one was close enough to what I
```

have to answer my questions. This thing followed me home from a hamfest,
maybe for use as a HV supply for an FET amp. Again, thanks for the post.

73,Mike W5CHR

Does anyone know where you can order a plastic 9v battery holder with
a snap off cover that flush mounts in a project box, guitar body, etc?
It would be like the AA battery holder in this Synsonics Terminator
guitar except for 9v:

http://meatexz.com/cheesyguitars/terminator/4c_1.jpg

So far for a 9v battery, the closest thing I have found is this:

http://images.google.com/imgres?imgurl=http://www.kemo-electronic.com/bilder/g03b/
g03b_320x229.jpg&imgrefurl=http://www.kemo-electronic.com/en/gehaeuse/g03b/
index.htm&h=229&w=320&sz=10&hl=en&start=285&tbnid=u0FQeM-PG-
g8XM:&tbnh=84&tbnw=118&prev=/
images%3Fq%3D9v%2Bbattery%2Bholder%2B%26start%3D273%26gbv%3D2%26ndsp%3D21%26svnum%
3D10%26hl%3Den%26sa%3DN

except this doesn't have a lip that would allow you to cut a hole in a project box (or in my case a guitar body) and screw it in so it mounts almost flush to the surface of the box (maybe about 1/8" or 2/8" would project out from the surface, the lesser the profile the better).
Also, the cover slides off to the side but I am looking for one where the cover lifts off straight up (again to facilitate mounting).

Any tips appreciated!

THIS IS GUARANTEED TO MAKE YOU MONEY!

READING THIS COULD CHANGE YOUR LIFE! I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and addresses stated in the article. You then place your name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands!) You can also e-mail it to some people. No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well, GUESS WHAT! ... Within 7 days, I started getting money in the mail! I was shocked? I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery! Let me tell you how this works and most importantly, why it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it). Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (plus postage). IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk -- it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:

Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 3 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. This is absolutely legal? You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the US Post Office (1-800-725-2161) and they confirmed that it is indeed legal! STEP 2: Mail the 6 envelopes to the following addresses:

1) A. Mosley F. D. R. Station PO Box 7455 New York NY 10150 - 7455 (USA)
2) J. C. Lamb 150-33 108TH AVE. Jamaica NY 11433 (USA)
4) A. Hutchins 1501 Shepherd Rd. APT.160 Lakeland FL 33811 (USA)

5) S. U. Peeler 209 N. Belcrest Ave apt. c202 Springfield, MO 65802
6) w. garland 5330 goshen rd. #43 fort wayne, in. 46818

STEP 3 : Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR name as number 6 on the list. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups.) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1241 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way, if you are of integrity, the program

will continue and the money that so many others have received will come your way, too.
NOTE: You may want to retain every name and address sent to you, either on a computer
or hard copy and keep the notes people send you. This VERIFIES that you are truly
providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to
reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully
followed, six members will be reimbursed for their participation as a List Developer with one
dollar each. Your name will move up the list geometrically so that when your name reached
the #1 position you will be receiving thousands of dollars in CASH! What an opportunity
for only $6.00 ($1.00 for each of the first six people listed above). Send it now, add your
own name to the list and you're in business! ---DIRECTIONS----FOR HOW TO POST
TO NEWSGROUPS---------- STEP 1: You do not need to retype this letter to do your
own posting. Simply put your cursor at the beginning of this letter, click and hold down your
mouse button. while continuing to hold down the mouse button, drag your cursor to the
bottom of this doc**ent, and release the mouse button. At this point the entire letter should
be highlighted then select 'copy' from the edit menu. This will copy the entire letter into the
computer's memory. STEP 2: Open a blank 'notepad' file from accessories in windows and
place your cursor at the top of the blank page. From the 'edit' menu select 'PASTE.' This
will paste a copy of the letter into notepad so that you can add your name to the bottom of
the list and to change the numbers of the list. STEP 3: Save your new notepad file as a '.txt'
file. If you want to do your postings in different settings, you'll always have this file to go
back to. STEP 4: Use Netscape or Internet Explorer and try search for various newsgroups
(on-line forums, message boards, chat sites, discussions). STEP 5: Visit these message
boards and post this article as a new message by highlighting the text of this letter and
selecting 'PASTE' from the edit menu. Fill in the Subject, this will be the header that
everyone sees as they scroll through the list of postings in a particular group, click the post
message button. You're done with your first one! Congratulations... That is it! All you have
to do is jump to different newsgroups and post away, after you get the

hang of it, it will take
about 30 seconds for each newsgroup! ** REMEMBER, THE MORE NEWSGROUPS
YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO
POST A MINIMUM OF 200**
That is it! You will begin receiving money from around the
world within days! **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **

It doesn't really lend itself to mounting in a guitar body like the
examples he gave but it might work for what he wants, and why didn't you
say so in the first place, why did it take someone else goading you in
to it after you made some snide comment about someone else's positive
suggestion?

Because I figured someone else might have the wits to look in the Mouser
catalog "in the first place".I had assumed that everyone checks
Mouser/Digikey,etc. My bad.
That was the first place I looked,and the first example I found.I'm sure
there are other sources,if ya look around a bit.

$16 for a battery holder is robbery,IMHO.

I have a Yaesu FT 2600 2m mobile and a Garmin eTrex hand held GPS device.

If I wanted to install this in my car so I could use APRS to track my
location, would I need any other hardware? (TNC?)

Thanks es 73

The Medical Community's Cheap Trick - What Is The Shank? - Discoloration Of Sexaling Organs - Sexaling And Prayer Statements - The Butt Hole Sexaling Organ And The Shank Sexaling Organ - Nerves - Nerve Units As Living Beings, I.E., Creatures - Brains And Notational Thoughts - Feeding The Organ Kiddies The Foods They Need - If We Were Able To Be Born With "Owner's Manuals" For Our Body And Brains - Duplicator Tests - Sexaling With Family And Friends - Massaging The Butt Hole And Shank - Sending Hillary And Obama On Their Final Rides - Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr. Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All The White House Staff, Etc. - A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A Number Of Other Lesbianists - What To Do, Now? - Compliance With The General Terms Of Their Settlement Agreements Persons Who Wish To Participate In The Former Sexaling Program - Qualified Card Carrying Members - Zealot Updated: 23-06-07 Rev.d 20:50 PDT

The Medical Community's Cheap Trick

A cheap trick played on medical doctors and students, untill they meet up with a human cadaver, is the cheap trick or lie that is perpetrated by the medical establishment on students of the medical profession.

How students of the medical profession stay quiet, after learning the truth, I do not know. It is a matter for each doctor to reflect upon, and for each medical student to reflect upon, and come to a reasonable answer for him self or for herself.

In other words, are they going to tell the truth or not. It recently came to my attention that the medical community is foisting, or purposely telling a lie to the public, with regards to the internal organs of the human body.

In particular, a stomach is not made up of twisting, turning, guts, or intestines, that go to one side and then downwards, and then side ways, and so forth, as depicted in this particular picture, of the so-called large and small intestines.

Please see, "Anatomy of the Large And Small Intestines"

http://medpics.findlaw.com/generateexhibit.php?ID=1696&ExhibitKeywordsRaw=Anatomy+of+the+Colon+(Large+Intestine)&TL=1889&A=42409

A similar faked drawing of the tummy tube, or shank, the descending colon tube, which is titled "intestines", along with a faked stomach drawing, by the Lesbianists and their bogus 'medical' establishment, can be found at:

http://medpics.findlaw.com/generateexhibit.php?ID=23&ExhibitKeywordsRaw=stomach&TL=1825&A=42409

Another bogus drawing of the abdomen and the supposed 'intestines', can be found at,

http://medpics.findlaw.com/generateexhibit.php?ID=13860&ExhibitKeywordsRaw=&TL=4294967295&A=42409

These pictures, and all other pictures like it, are totally bogus. There are no guts, bending and twisting to one direction, and then to another direction, that eventually find an outlet at the poop hole in the human body.

Chimps, apes, and monkeys may have these types of stomach 'tripe' that is longish, twisting to one side or to another, going back and forth, and then wrapping or folding down under other tummy tubes, and then twisting in and then moving outwardsly, as chimps, apes, and monkeyes live on banana foilage, twigs, seeds, hard shells, and other difficult to eat, hard, rubbery, plant roughage, of one kind, or of another. Some oselots may have this kind of tubeing, and so may many other animals, but not the human being.

In the human being, there is in reality, no such guts or tripe tubeing, and there is what is called a 'shank'. A shank is the human being's tummy tube, or the desceding colon tube.

Your tummy tube descends from the front right side of the tummy, in the near to upper to middle to near lower area or section of your tummy, depending on the person. Some people, may have their tummy tube, the ejector pipe, also called the descending pipe, a little higher up, than other people. Some people may have their ejector pipe a little lower than other people. That is not significant.

The muscles inside of the tummy, and surrounding the tummy, cause a pushing motion, to eject the tummy food, that has made its way to the back side of the inside of the tummy, and to the lower or middle area, near the eject pipe, on the inside of the tummy. Once your tummy food makes it there, the muscles begin to squeeze on it, and the muscles on the inside and on the outside, squeeze on it, and force it up and out of the ejector pipe, and down a chute, or the descension colon pipe.

The descension colon pipe goes in a nearly straight line, almost perfectly straight, in some people, directly to the out put terminal, which is the poop hole.

The intake for food and beverages from your lips, mouth, to your throat, or food pipe to connect your mouth to the tummy, that connector location is on the top side of the tummy, on the left side of your tummy, as you face forward. There is a tiny amount of terminal area, that's your stomach area, that is the terminal area, on the top side of the tummy, that is to the immediate left of the intake tube terminal entry way, itself. That means, there is a descending tube from your mouth to your stomach, and it connectes to the left side of your stomach, not all the way to the left, but nearly all the way to the left side of the stomach, but on the top, generally, and in some people's cases, it is a little down, from the top, less than an inch or two from the top.

So the intake tube from your mouth sort of goes in to your tummy, from the front of the tummy, a little lower than from the top side edge of your tummy. The top edge of your tummy is located just about at the same height as your titty nipples are located on the chest. The little inwardsly pointing, dimple, in the middle of your chest, a very large dimple, just above where the rib cage begins to open up and spread apart and where the tummy muscle cavity can be felt, that dimple, or inwardsly pointing cavature, or the caving inwardsly of the chest bones in that area, some times slightly below, sometimes slightly above that point, is where the tummy's top edge is found. The tummy's top edge runs horizontally, more or less, across from one side to the other. It does descend at the outer edges of the tummy, to form a pouch system.

A bogus drawing of the Lesbianists' pretend 'esophagus' for all the med school students to ponder over, and of a pretend tummy, which has the connections on the back side, where they are not located, but on the front side, where they are located, can be found at,

http://medpics.findlaw.com/generateexhibit.php?ID=4599&ExhibitKeywordsRaw=esophagus&TL=1825&A=42409

The tummy does not look like a cashew peanut, like in the drawing. It is a pouch, and it is more oval in shape, kind of like a box, but a little long or rectangular, some may say it is similar in shape to a peanut, or to a raisin, or to a plumb, and it runs lengthwise from one side to the other, with the narrow part of the oval running horizontally. It is nearly a perfect, very slightly long, oval in shape.

The descending colon pipe, your tummy tube, which goes nearly in a straight and almost perfectly vertical, in many cases, direction, to your poop hole, from the ejection outlet port of your tummy, which is on the front side of the tummy, on the front right side, as mentioned above is very long, and in some women, the tummy rests slightly higher up, a tiny bit, to allow for a longer 'shank', or sexaling tube.

What Is The Shank?

The shank, if we look at the opening and entrance to the shank, the butt hole entrance, the shank is a multiple duty, instrument. It is a nearly straight tube, and it allows food to exhaust from the tummy pouch. It also allows a dick to be placed up into it from the rear upwards, and a dick can be very long, in some cases, and there for, the tummy tube, or shank, is very long, and also, importantly, it is generally straight in most women and girls and in lots of men and boys.

Discoloration Of Sexaling Organs

If we look at the dick, or if we look at the scrotum, we will see it is a darker, slightly discolored body instrument. The vagina is slightly discolored, and so are the titty nipples. So are the lips, the inside of the mouth, the throat inside, and in various other places, depending on the person. The palms of the hands, the undersides of the fingers, the soles of the feet, the toes, the ears, the cheeks, and the underarms of people are all discolored to one extend or another. The discoloration is an indicator of the fact that these sense organs, or love making instruments, are major sexaling instruments. The other organs of the body, are minor sexaling instruments. All of them, are sexaling instruments when you activate them, by massaging them, and by rubbing them, and so forth, and they will begin to shoot off energies, and those energies will purify and holyfy your life and clear up your karma and the karma of the people around you as those energies will shoot out in all directions cleaning up my universe, as they go zinging outwards. The energies will erase your karma, over time, and if you pray with a prayerful minded statement in mind, while sexaling, your karma that is related to that prayer, that needs to be erased, will get erased, little by little. For examply, "I pray that I will be able to have the good health and prosperous life, that will allow me to live, comfortably, and without distress."

Sexaling And Prayer Statements

The negative karma that you have, that would prevent you from living a healthy life, that is also prosperous, and without distress, will slowly, over time, get erased, as you make your statement, every time you begin sexaling, or every time you begin a sexaling session. If your sexaling sessions are going to go for days, say, three to eight days, for instance, you might want to repeat the prayerful minded statement, every eight to twelve hours, to fifteen, to thirty, to fifty hours, or so, to 'freshen' it up, once every so often. The more you freshen it up, the better it will work. The prayer will apply to not only you, but to every one else who is sexaling, if you say, "I pray that I and every one else will be able to have the good health and prosperous life, that will allow not only myself, but all other people, as well, to live without distress." This statement is a bodhisatva minded statement, and it will produce better results. Prayer statements said with others in mind, in addition to your self, produce better results, as a general rule. Why is that? Because we want to purify not only your karma, but every one's karma, and you get extra points for thinking about every one else and their needs, as well as your needs. Not only your self, but every person who is sexaling, during the time you are sexaling, and during the time, you continue or plan to continue sexaling, as one long sexaling session, will benefit from this prayer statement.

The Butt Hole Sexaling Organ And The Shank Sexaling Organ

The butt hole is also discolored, in all human beings, and that is an indicator that the butt hole is a sexaling organ.

The discoloration of the butt hole entrance, is an indication of the fact that the butt hole entrance is a sexaling organ. If we look inside the butt hole, we will notice that the entire length of the 'shank' is discolored, and therefore, the entire shank is a sexaling organ. Sexaling organs are different in coloration, than the normal skin coloration of the body.

The discoloration is due to the fact that there are a gazillion plus tiny blood carrier veins and arteries, that are very tiny, so tiny, you can not see them with today's 'current' medical microscope technology that is in the hospitals and labs, used by doctors, scientists, and lab technicians. These tiny blood 'capillaries' or fluid flow ductways, are too small to be seen by a doctor's microscope, or by a lab technician's microscope. These fluid flow ductways, or capillaries, are all clustered together, in high densities. When they cluster together, that is for a purpose.

They are clustered together in high densities to allow for fluids to flow to the nerves in that area of the body to feed all the mouths in the nerves of that area of the body. There are clusters of sense nerves that are extremely dense, in all the sexaling organs. Where there are high densities of sexaling nerve clusters, there are lots of fluid flow ductways, or capillaries, and the area of the skin that is visible to your eyes, will show a slight to moderate, to heavy discoloration, due to all the fluids flowing through the area, carrying food and nourishment.

Nerves

Nerves are organs in them selves. The smallest nerve organ is a nerve cell, perhaps. My memories are not very good, so we might find smaller nerve organs, as my memories improve. A nerve cell has all the organs in it, to allow it to function as a normal, living being. That means, it is alive, and it thinks, and it cogitates, or mulls over thoughts, and it considers, for instance, 'What am I going to do, now', and it has lots of thoughts, and it stays busy doing lots of thinking, and by doing lots of cogitating, and by doing lots of communicating with other nerve cell organ kids of mine.

Nerve Units As Living Beings, I.E., Creatures

Nerves, just as nerve cells, form units, and as a unit, they form a living being, or creature, and all of them have mouths, since all my creatures have mouths, and they all need to be fed.

The sense nerves, the erotic nerves that are clustered together, need to be fed the foods and nourishment that they need to be healthy and fit, so as to be able to respond, to stimulus. They need to eat to be healthy, so that they will then be able to respond when stimulus is applied to that area of the body, where they are located.

Each organ in the body, has a brain, and a mouth, and a stomach, and a poop hole, and a pee hole, and all the other organs they need to survive with.

Some organs, maybe all of them, need to feel comforted by other organs, i.e., creatures of the same kind as they are. Some organs like to not only speak to other organs creatures who are like them, but they also like to snuggle up to one and another, and they get cozy with one and another, all snuggled up, suddenly, before any one new it, pwoop, and they make a baby organ or creature who looks like mommy and daddy.

Organ creatures of course can sexal, because if they could not, they could not make baby organ creatures. Organs can sexal just like human beings can sexal, but they sexal in their own particular ways. They like to sexal, just like human beings like to sexal, and they also go ouch, when some one or some thing pokes them, or pricks them, such as the doctors needle at the doctor's office.

Each nerve cell is built with all the organs it needs to survive, and each organ is built with all the organs it needs to survive. The number of organs in the human body is almost limitless, but not quite limitless, as you can still count them, all, if you have the time.

Brains And Notational Thoughts

Each organ is a living being, or creature, with a brain, and with notational thoughts. Notational thoughts are memo types of thoughts, such as about, 'oh, boy, that sure felt good', or 'golly, gee, I am really bored'.

One notational thought, for instance, that is of use to you, is when you are in need of water, and you begin drinking water, when you get the feeling that you need lots of water, and you get a message to your brain that you are in need for water, because you know you are low on water, and almost out of it, well, the inspirational thought that tells you, "keep drinking, keep drinking, you are too low on water" that is an inspirational thought, that your tummy and its brain is passing on to an area of your conscious mind, where you can then pick it up, and then act on it.

There are many kinds of notational thoughts organs can have and organs can pass on to our 'brains'. Organs, as living beings, also do lots of chit chat with other organs, not only with the organs inside of your own body, but also with the organs inside of the body in other animals. Brains are brains, and they are very smart, if they are to do the duty they are assigned to do, which requires them to be smart. They are so smart, they spend a lot of their time, communicating and chatting with other organs, to see if every one is alright, and to find out what the latest gossip is. They can do many things, and that is the topic for another time. But one thing they can do is talk to each other. They have their own languages, they speak to each other with. Did you know that? I bet you didn't. If you are a Lesbianist, you may probably know this, as you probably studied about it, in your school days. Some kids, five or six years old, study these things, on planets, where education is up to the standard, that I set it at.

If we understand that brains are in every organ in the body, and some organs, have multiple brains, almost all of them do, and if we understand that they are able to communicate to each other, than we can understand that the vagina is a living being, and it has a brain, and it talks with other vaginas, in other women and in other girls. The dick has a brain, too, and it talks with other dicks, and it talks with vaginas, as well, when a vagina calls to a dick, and asks it questions.

Feeding The Organ Kiddies The Foods They Need

We need to feed the body, many foods, not only tomatoes, potatoes, asparagus, meat, and fruit, etc., but we need to feed foods to our body for feeding the organ kiddies, the organ animals, the living beings, or creatures with brains, called organ kiddies who are inside of our body.

What are we doing when we feed the body? We are supposed to be feeding not only our face, loading food in that tastes good to us, and to our sensibilities, but we are also supposed to be feeding the animals that live in side of us, as well as, we are supposed to be feeding the organ kiddies, who also need food to stay alive. We also need to be feeding all of the other animals kiddies, the living creatures of various kinds, that are living inside of our bodies. Most organ kiddies are on a starvation diet, nearly, and they survive on nearly only water. Some are lucky and get some pee and poopy juices from animals that live inside of our bodies.

Most of the organ kiddies are not lucky, and they languish, from day to day, with nothing to eat, and they hang on, and they do their best to perform for us, but in the end, they are defeated by our not feeding them, and they give out, and give up, and throw in the towel, and say, "To hell with it. I don't care anymore." and with that, they cancel their agreement to work with us, and they say good bye, and they then slowly perish, and as they do, so do we. We perish because we do not feed the organ kiddies in our bodies, and because we do not feed the cell kiddies in our bodies, and because we do not feed the amoebe kiddies in our bodies. If we feed them all, we would not die, and they would continue to live, properously, and progenerate, or give us babies, to take over the jobs of mom and pop, Sr., the first organ kiddies in our bodies, who want to work with us, and who want to be fed, while they work for us, when mom and pop, Sr. are near the end of their run, that is their work life, and when it is time to call them in to my Epcot Centers for them, for them to get their check up, and repairs that they need, to their brains, and to their nervous systems, and to relieve them of any undue or unwholesome stresses, nervous tension, migraines, and so forth.

You might be thinking, "This is a joke", but it is not a joke. You are completely wrong if you think this is a joke. If you feed the foods that organ kiddies like to eat, to them, they will become alive with activity, and they will work hard for us, and we will feel a new sense of vitality, and we will regain our good humor, to some extent, as it is a karmic issue here, as well, having a good humor, or a pleasant personality, and when it is time for mom and pop, Sr., organ kiddies to pass on the work load to baby Mac, and baby Sarah, organ kiddies, Jr., they will pass on the work load to them, and Poppa and Momma will retire and make their way, with assistance from their kids, and with assistance from my kids, to my Epcot Centers for them.

This is a complex topic to discuss, and I won't try to discuss it in full, obviously, as I am too stupid, and my brain is not working, and I can't remember every thing about it, obviously. But, you should know, that if you feed them the molds animals, the molds fruits and gardens produce, and the funguses they like to eat, and that they enjoy eating, and the other foods that they eat, from fermented mash, made correctly, and from molded foods, and from molded breads, molded chesses, properly cooked meats, and so forth, they will feed on the animals in that food that you prepare for them, and you'll get healthy, and they'll get healthy, and they'll live for three hundred to eight hundred to fifteen hundred years, or more, depending on which ones you are talking about, and they will work for you, with zest and vigor, before it is time to hand over the work load to baby Mac, and baby Sarah, organ kiddies, Jr.

If We Were Able To Be Born With "Owner's Manuals" For Our Body And Brains

We are not born with an owner's manual for our body and brains, etc. If we were born with one, we would be told that if we feed our body properly, the body will last us forever, and we will be able to live forever. This is the norm for the human body. It is not a 'dream' or 'hope', or 'wish'. It is merely the truth, and once you learn how to feed your body, and all of the animals and creatures inside of your body, you will begin to make all the animals and creatures inside your body, happy, and they will begin to work for you, as they were intended to work for you. They are all my worker animals, and they are here to work for me. I have many worker animals, and we will learn about all of them, and we will find those who we need to help us feed our bodies properly, so that we can all live in the body that we were born in, that is meant to last you forever, if your feed it and nourish all of the animals in it, properly.

If you do not feed my worker animals in your bodies, the nutrients, the animals and the plants animals and the foods that my worker organ animals in your bodies like to eat, that will allow my organ worker animals, and all of my other worker animals, to live with vigor and tenacity, strength and good health, they will not work very well for you, and in time, they will all perish, and so will you. I mentioned my worker animals in the molded foods, molded fruits, molded citrus fruits, fermented beverages, and so forth, that we will be making. They are all there in those foods that we will make, and then use to feed ourselves with, to then help feed all my worker organ animals, my worker cell animals, and other worker animals, that are in your body, and that need to be living in your body, working hard for you.

If you do not feed them the foods that they like to eat, they will not live for long, and they will perish, and die, and that will be that, and you will not have a chance for living more than a hundred or two or three hundred years, in that body of yours, if your karma is good, and if you were not being poisoned by the petro chemical industry, and the chemicals industries, and by the foods manufacturing industries, and by the pharmaceutical manufacturing industries. We will never hear the Lesbianists admit that they are intentionally poisoning us, but they are.

Once you find a way to survive on molded up, wholesome natural healthy foods, with no pesticides, and on water that is not chlorinated, and that is wholesome to drink, and after you learn the abc's of proper eating, to feed every one in your body, as well as you, then you will not die and you will begin to live forever.

The Lesbianists are afraid that you will learn to eat properly and then, when you begin to get your diet together, not only for your self but also for all the animals and organ kiddies in you, and for all the cell animals in you, or cell creatures, who are smart living beings, by the way, you will begin to be able to extend your longevity, and then, in time, you will be able to live forever.

If you stop drinking the poisonous coffee in the office, as I've explained about, previously, the Lesbianists make it with diesel fuels, and with gasoline, and with kerosene, if you stop smoking the poisoned cigarettes, if you stop using the plastics furniture, and other plastics products, if you stop inhaling the gasoline fumes kiddies that cause fibromyalgia, and fumes animals cause the sharp pains in the body as the fumes animals eat up and destroy the organ animals in the body discharging energies or electrical currents, as they mate, and as they sperminate, and vagicate, or eject female animal sexaling juices, like some jelly fish do, and like some deep sea snakes, and worms, that are lit up, with pulsing lights in them, when they mate, do. Fumes animals also cause arthritis, ligaments problems and diseases, and other health problems. If you stop inhaling the plastics fumes kiddies, which also give you fibromyalgia, arthritis, etc., and kill brain cells, and cause brain rot, Alzheimer's disease, and parkinson's disease, and a number of other illnesses, and if you begin to eat properly, in accordance with the proper rules for diet, that our body and brain owner's manuals would explain about, if we were to be born with these manuals at the time of our birth, then, you will begin to get healthy, and you will begin to live forever.

So, good luck, and do not vote for Hillary Clinton, or any of the other presidential candidates, and if you see them, give them a beaver cheer, some people call it a 'Bronx cheer', and the noise you make sounds like someone farting in their direction. That may sound childish to say, but it is what the Lesbianists deserve as you are being played for a fool, every day of your life, and you should snap out of it, and do some thing about it, as soon as you and your friends can get it together to begin sexaling, in the ways I've explained about.

Duplicator Tests

In a duplicator test, there is one strand of a piece of the body, and you take that strand, and with medical and scientific technologies, you attempt to make a copy of it.

Why do they make a copy of a strand of a piece of a human or ape, monkey, dog, or cat, etc., body?

To test for various possibilities as to who the strand came from and how the strand came from the source, and what has happened to the person, if it was a person, if the person is no longer here to stand in for himself or for herself, in the case of a missing person, for instance.

What is meant by a strand of a piece of a human, etc., body. Usually, a piece of flesh is a good place to start. A clipping from a person's finger nails, can be duplicated, if the sample is tiny enough, and it can be analysed, and then compared with an original shard or piece from a person's finger nail, a known subject's finger nail, and then a match up can either be made, or not be made.

Human blood cells can be duplicated and matched. Human skin tissues can be duplicated and matched. Human organ tissues can be duplicated and matched.

These matching tests are in fact, one example of a organ animal giveing birth to a baby organ animal, or to a number of baby organ animals.

I'm not sure what they call the test, in the laboratory, but that is a duplicator test, in my vocabulary, and it should be a simple test that all county, municipal, and other police medical technical labs, forensics labs are capable of performing.

This example of a matching print from the one strand of a piece of the body, is an example of organs animals, giveing birth to baby organ animals.

Red blood corpuscles, are often tested, in this manner, I believe. A corpuscle is an organ animal, and it will give the same results, and you can make baby blood corpuscle organ animals.

A high school, or jr. high school science lab technician or teacher, or in some school labs, including jr. college science labs, and technical labs at medical technical schools, teaching assistants, should be able to perform this test as it is a simple test to learn how to perform, and even off duty police officers, are taught it, in their free time, for fun, or for advancing their career. Licensed Practicing Nurses (LPN's) generally know about this test, and so do all doctors as well as your general medical school student, and two year college, or four year college, nurses course students. Botanists know or should know this test, and there are many professions where in this test is common, such as in paleontology, the study of human remains, bones, and so forth. I don't know what people on this planet, understand a paleontologist (Note: 'paleo-entologist' I think may be the correct spelling, but I'm not sure) as, but in my vocabulary, as it is comming back to me, a paleontologist explores and investigates old bones, fossilized bones, old grave sights, and so forth.

Elementary school students, and maybe some kindergarden school students, in advanced kindergarden schools, such as in Japan, and in Europe, and in different countries around the world, can do this test, if their science lab teacher lends them the technical books, and tools to take home, study, and then show the family and parents, how a duplicator test is done. It's not a difficult test to perform, if you can read, and if you know what a beaker is, and so forth.

This will give you a start for the search for proof as to whether or not there are organ animals in the human body, and in all animal body's and in all living being's bodies. It will provide proof that organ animals, once you've identified them, can in fact give birth to baby organ animals.

There are a number of types of duplicator tests, lab technicians perform, in their day to day job routines, in medical labs, and the duplicator tests are generally for making comparisons, of one type or another, or for one reason, or another. They all give the same results, they provide you with proof that organ animals do exist in the body, and that organ animals do make babies.

Sexaling With Family And Friends

Sexaling with your family, relatives, trustable neighbors, and so on, will help you to begin to erase your karma, if you begin your wholesome, purifying, and holyfying sexaling with your family, relatives, kin, trustable neighbors, and others who are trustable. As you erase your karma, little by little, you will begin to get better karma, and you'll begin to be able to get rid of these Lesbianists who make fools of all of you, and who toy with you, one life after another, as you go into my Epcot Center, and then come out again, as a tummy baby to a tummy mommy and to a tummy daddy, on a fairly predictable basis, meeting up with your former friends and colleagues, over time, and then going through the six, or ten, or twelve, or forteen, or sixteen, etc., years of schooling, each time you come out, to lead a very short life span, with, once again, all of your organ kiddies and other animals and living creatures in you, nearly starving to death, the whole time you are out here, with your friends, playing, golf, swimming, playing tennis, football, entertaining the Lesbianists, and so on, until it is funeral time, and then back, once more and into my Epcot Center, until a new tummy mommy and a new tummy daddy, are waiting and ready for you to come out again.

This is not a joke, I need to repeat, and you should start thinking about doing something to bring a stop to this abuse of your organ animals and other living creatures in you, and to bring a stop to the abuse of you, by the Lesbianists who will not tell you how to do any thing that is good for you and that is good for your health.

Massaging The Butt Hole And Shank

If you work massaging the butt hole for a few hours, fluids will begin to form, and the tissues of the shank, and of the butthole, will become more pliant. They will become stretchable, and they will, after a number of hours of massaging the butt hole, and the inside of the butt hole, little by little, as you insert a dick up the hole, as it gives way, and becomes more pliant, after a few hours, or so, it will soon be able to become opened up completely, and a dick can then be inserted and the shank then becomes a sexaling tube.

On the end of the dick, there is a 'pooper scooper', or head level scoop pipe. The head level scoop pipe is the peculiar shape of the dick at the tip of it. This shape allows you to insert the head of the penis into the butt hole, and then take a wee wee, and then mush up all the food that is stuck in the cavity, and after a little mushing up of the food in the tummy pipe, or shank, you can then begin to scoop it out, little by little, with one dick shovel head, after another.

After seven or eight dicks, to twelve to thirteen, or so, on the job, pumping, and peeing, and scooping out the poop, and ejaculating, as well, you can eventually scoop out most of the poop from the shank. Some may remain near the top, so a few more pee pee's into the butt hole, will help wash out the tummy tube, and it will become clear and free of digested food matter.

The large and small, i.e., the meaning or intent of this paper, or note, is to let you know that the poop hole is a sexaling organ, and that the poop tube is a straight tube, and not a twisted up, bundled up, chimpanzee, or oselot guts piping, or bear guts piping, or horse guts piping, or pigs' guts piping, or cows' guts piping, as the medical community, would like to have you believe, along with the hoards of bible thumpers, who colluded with the Lesbianists of the medical community, to keep you in the dark ages.

You are being played for a fool, every day of your life. If you can allow the Lesbianists to make a fool of you, every day of your life, and if that is alright with you, than go right ahead, and play their game, and let things stay as they are, but if you are not willing to allow them to make a fool of you, then you had better get busy, sexaling, and so forth, as I've already told you what we need to do, to help bring about the changes we need to make.

Sending Hillary And Obama On Their Final Rides

A vote for Hillary Clinton for president is a vote for stupidity, on your part. A vote for Obama for president, is a vote for stupidity, on your part. Now why doesn't somebody kill Hillary Clinton, or Obama, or both. I just do not understand. Do you? I don't.

Next time you see Hillary, you can ask her if you can open up the front of her chest cavity, and take a look inside to see if she has a shank, as I described it, or if she has a twisting and turning, animal type set of guts, like many animals do. I think you'll find that she has a 'shank', and not a twisting, turning, animal set of guts.

All human beings have shanks, and not one human being has a set of 'animal' guts. Human beings have shanks for fuckaling, that is, butt fuckaling, but no one, except the Lesbianists, know about it, and as a result, no one ever thinks about butt fuckaling, as a type of sexaling enjoyment, and a sexaling past time.

Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr. Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All The White House Staff, Etc.

Well, I have told you about many bombs you can make, on my web site, and I suggest you begin to think more seriously about taking out Hillary's cavalcade of automobiles, next time she is riding through Washington DC. Or the next time you see Mr. Obama, please consider blowing his cavalcade of cars and limousines, up and out of the upper solar atmospheres, with the bombs you can make, as already explained about, in my notes, on this bulletin board.

After you blow them up into bits, and pieces, they will be fine, as they will soon be coming out of my Epcot Center, as tummy babies, and they will be two less threats to the ordinary and normal people on this planet, for some time to come.

A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A Number Of Other Lesbianists

Before you blow up Hillary, find out if she is with us, on this, or what. I think Mr. Obama is not with us, yet, but it may be the case that Hillary Clinton, along with a lot of her friends, is now on board, and she is hoping to set sail with the rest of us, but is not quite able to break away from the Lesbianists' and their organization, since she has been a friend with them, and a member of their organization for umpteen millions, billions, trillions, and zillions, plus years, since long before they ever even came to this planet, to settle it. These people, Hillary Clinton, and a number of her friends, are ready to make the change over, but lots of Lesbianists are not ready to make the change over, and so Hillary Clinton is kind of stuck, and so are all the other Lesbianists, who want to make the change over, and who want to say good bye to their former organization.

In any case, this planet is crawling with animal people of all kinds, as I've mentioned, and it is a very unpleasant situation, and the Lesbianists know this, as most of their membership has already been eaten up by animal people, and there are many types of animal people. Many of the animal people who ate up the Lesbianists below ground, are walking around, as they imitate, or take on the form of human beings, after they eat one. Not many of the original Lesbianists are still alive, down below the surface of this planet, in their underground cities, as I've recently learned, as most all of them, close to ninety nine plus percent to nearly one hundred perecent of the Lesbianists down below the surface, have already been eaten up. There are still a lot of Lesbianists down below us, below the surface, but compared to the numbers of them who were there, before, there are fewer, now.

What To Do, Now?

I thought my kids were ready, with an underground system of 'safe harbors', but it seems there is a delay, and I'm not sure when the delay will be resolved. Until it is resolved, I guess we are stuck where we are. So, the only thing to do is to get the government to make the needed changes, and to step up to the microphone, and denounce the Lesbianists organization, by telling every one that it exists, and that we will now build a one world, government. When the politicians decide to do that, and when we begin building a one world government, then maybe we will begin to see some resolvement to this situation.

I have some more ceremonies to do, and I have a lot of time to wait, till we see a resolvement to this situation. The additional ceremonies will assist us in making a safe harbor, as far as I have heard, that is fully integrated, and that has all the protection and safety systems that will be needed. All the different components to the fully integrated system, for covering our immense universe, all at the same time, are not available, yet.

There is a lot to learn, about who else lives in our universe, and about where my kids live, and about what my kids do for me, keeping my universe running for me, along with a lot of other information, for you to get and read, and then understand, about my kids.

As soon as the local, or federal governments around the world release the software that will allow people to upgrade to the 'Managing My Universe' software upgrade, from the databases, that are located in the underground bunkers the Lesbianists used to use when they first arrived, and when they were in the 'sexaling for a living' program, which all of them were in, when they arrived. These databases are also located on other planets where there are bunker systems, and where there are communities of people, who are in the 'sexaling for a living' program.

Also, once the 'Managing My Universe' program software is released, and once people start using it, and once they set up their own network, that it will run on, and once enough people are running that software on their computers, we can have a partial soluition to the problem of the animal people, as well as a partial solution to dealing with Mormons, and Clerics, and Protestant leaders, who believe in "Jesus Saves" and other such useless nonsense.

I think the Jesus Saves group, i.e., Christianity, the Mormons, Protestants, Lutherans, Catholics, Presbyterians, and so forth, is built on Islam, and on Judaism, or rather, on one of the schools of Judaism, plus maybe some other things, made up, or grafted from other religions that were primitive religions, such as Voodoo cults, and worship of the dead cults, as well as other cults, and they were all squished together, and the result was, "Christianity", but that was after all of my teachings were clipped out of the two above mentioned religions that I had taught.

In any case, not a one of them has a clue that sexaling is a 'purifying' activity, and women and their sexaling bodies are like 'purifying' engines, or washing machines, as I've mentioned before, and men and their sexaling bodies, are also capable of becoming 'purifying' engines, and washing machines, though we all have our karma, and it will be a while before we erase enough of our karma, to make a difference, for some of us. That means, some people are better able to sexal than others as their karma for sexaling is better for sexaling than the karma for sexaling of others. We have a lot of karma to erase before we all begin to pick up enough steam to get any where, sexually speaking.

I think that is the general situation, for most, but there are some people who are more gifted than others, and there are some people who are, when it comes to their sexaling capabilities, generally speaking, fine.

With the use of aphrodesics, fruits that we can grow, that must be taken off the 'banned' foods lists, vegetables, nuts, and other foods that also are useful aphrodesics, that must also be taken off the banned foods lists, we will be able to make better progress. Sessame seeds can mold up wheat bread to make a nice aphrodesic, from what I've heard, and I will give it a try, one of these days, as I'm busy, molding up a few other things, first, sort of for experimentation, as this is all new to me. Peanuts supposedly, might be aphrodesic, once you mold up wheat bread with them. I believe they have minor pain killing properties, as well. Dark green garbanzo beans, sold in Indian food markets, also mold up wheat bread and are useful as aphrodesics. White bread is too poisoned to consider for use. Please use only whole wheat bread, or a bread of fine quality. Do not use white bread or normal white french bread, as the flour used in making them is treated with bleaching agents, that are poisonous.

Compliance With The General Terms Of Their Settlement Agreements

In any case, we need all the laws changed, as I've mentioned about, before, and we need the governments to form a united, single planetary government, and we need every one to begin to get the information they need, and the assistance they need to begin to cooperate with each other, in science, and in agriculture, and farming, etc. We need to ban pesticides, the use of petro-chemicals in the manufacturing industries, the promotion of natural fibers, and natural oils for manufacturing, and the switching over to non-polluting, hydrogen based technologies, and so forth.

We also need the volumes of Greek literature released, as well as all the other literature, that needs to be released, that the initial settlers of this planet, were given, to use to set up their planetary government, with.

When we start to see that these and all the other neccessary steps are being undertaken, in an effort to accomplish them, we will be in a better situation to begin to see a resolvement to this situation. The Lesbianists do not like to be forced into doing things, but in this case, there is no other way of getting these things done, and so if we need to force them to get them to move off their fannies, and get their butts in gear, than we will have to do just that.

We need the Lesbianists, and all the other groups of people on this planet, who legally, or rather, legitimately settled this planet, but who are not in compliance with the terms of their settlement agreements, get into compliance, and the sooner they get into compliance, the sooner we will have a resolvement to this situation.

Persons Who Wish To Participate In The Previous Sexaling For A Living Program

I have talked about the previous sexaling for a living program, that people were signed up with, a long time ago, when they first settled this planet. I mentioned the underground bunker systems, that my kids still keep for eligible card carrying members. I suggested that there might be people who died, and after they came back from the Epcot Center, they no longer knew any thing about the 'sexaling for a living' program, that they were affiliated with, and they forgot that they were a valid card carrying member of the program.

Even though these people, may not remember that they were once in the program, since they don't usually bring that information with them, when they are tummy babies, in mama's tummy, these people, if they wish to get back into the 'sexaling for a living' program, that they were once a participant in, they may write a statement, and state that they wish to get back into the 'sexaling for a living program'. They need to sign it, and press their energies into it, just as I explained, about, before. For example,

Affidavit

I, ____name____ would like to get back into the sexaling for a living program, that I was an active participant in, previously, and that I continue to belong to, as a valid card carrying member.

Signed: (signature)
Date: (Date)

Then, press your finger, or thumb, or elbow, or toe, or nose, or lips, or palm into the paper you wrote, above your signature and date area, and make sure you press in your energies, as well as you can, and that should wake up my kids, and get their attention. When my kids have verified that your request is legitimate, they will buzz you in, or rather, teletransport you into the underground bunkers, that still exist, in many places, on this planet, and under the surface of this planet. These bunker systems exist on other planets, as well, and so every one who is qualified, no matter where they are, and no matter what planet they are on, can get back into the program, so long as my kids authorize and approve their request for entry into the program.

This will get you started. You have to be certain, that you wish to start off, again, and that you are sincerely interested in getting back into this program, to sexal for a living, in accordance with the rules and guidelines of the original program.

Once you are in the original program, now as a participating member, you can begin sexaling for a living, and you can also, begin to study about the new 'sexaling for a living' program, and the 'managing my universe' program, and the other programs that are now available, in the Gurkian Age. There are introductory courses for people who are not familiar with the program, and your questions will be answered in the seminar like introductory courses.

Once you decide to join with one or more of them and once you decide to get into the Gurkian Age Religious Revolutionary Movement, and then begin sexaling for a living, as you get fit, and healthy, by your participation in these and other activities, as well, such as the club activities, as I've mentioned about, before, so that you can sexal more adequately, and robustly, for, eventually, days, then weeks, then months, then for years on end, without tiring out, too much, and in between sexaling activities, you will have lots of other activities, such as the club activities, to vary the pace of your life, to make it more interesting, and more engaging, by meeting with lots of people in the clubs, and by learning about these people, and by sexaling with them, once you've decided you would like to join, then you can switch over to the new programs, in the Gurkian Age Religious Revolutionary Movement, and get started when the facilities for them, are constructed by my engineer kids, and by others of my children, who will be helping them.

When we have all of the facilities needed, the new programs will open, and you can switch over to the new programs and my kids will help you with the paper work to transfer over your membership to the new programs, in the Gurkian Age Religious Revolutionary Movement.

Qualified Card Carrying Members

Some of the people who I've mentioned before, such as Jodi Foster, Jennipher Lopez, Madonna, Angelina Jo-li, Jack Nicholson, Angelica Huston, many actors in the New York actors' guild, many members of the west coast actors guild, and many members of actors guilds around the world, and also, many members of dance troups, and dance guilds around the world, singers, musicians, entertainers, members of the military, members of law enforcement agencies, and so forth, many of these people, and others, as well, are qualified as valid card carrying members of the original sexaling for a living program, that the initial members and follow up members of the out bound programs for the settlers to this planet, were all a member of.

Even if you do not think that you could possibly have been a member of one of those out bound settler's programs, you may have been one, and if you write an affidavit, in the form as I've mentioned above, you may find that in fact, you were a member of the out bound program of settlers to this planet, or, you may find that you were a member of one of the other out bound programs, to other planets, and you may find that you are still a qualified, card carrying member who is entitled to rejoin the sexaling for a living program, that you were once a member of.

How is this possible? How can you still be a valid member, after all this time? Well, it is just that we need to get you started, and so these facilities, the underground bunker systems, that I've mentioned about, before, are there, and I was told by my kids, that you can make and sign a statement, or an affidavit, in the manner in which I mentioned, above, and that will be all you need to do, to get back into the program, you were once in. We are extending the time limit on the previous sexaling for a living program, as a short term measure, to help get things started up, again.

Zealot

Joining the original program, applies to all valid card carrying members, whether they currently know they are with an out bound settler's group, or not. That means, that Ms. Hillary Clinton, can get started up, again, as the time limit on the program has been extended, and so can Mr. Bill Clinton, and so can Chelsea Clinton, and so can all of the other people, who prefer to consider them selves as 'radicals', and they prefer the term, 'Zealot' as in, a person who has a lot of zeal for living, to the term, 'Lesbianist'. So when you see some one you might recognize as a possible 'Zealot' it is polite to use the term, 'Zealot', and not use the term, Lesbianist, as 'Lesbianist' has too many negative feelings attached to it, and people might start using it as a way to make others, angry.

You do not get points, for starting fights, or for getting other people angry at you, for teasing them, and so forth. So, let's all behave, and let's all get into the program, those of you who are eligible, and let's go from there. If you have a friend, who might not be eligible for the program, you can make an application to allow the person into the program, and then my kids will approve it. The person will then get accepted into the sexaling for a living program for the out bound settlers.

Captain Off The Bridge.

What Is Tin

Tin ore is a metal ore, and it is found in cassiterite, as listed in many books, and it is also found in iron pegmatites.

Iron pegmatites are its chief source for supply of this mineral ore. It is like gold, or barium, or silver, and it is found in many pegmatites.

What is barium? It is a mineral that is found in steel ore, or iron ore, and it is a tough metal, and it is very strong, with great tensile strength.

What are pegmatities?

Pegamatites are large stones that contain mineral ores.

A pegamatite ore stone can be found in silver deposits, and in gold deposits, and in many types of mineral deposits.

Pegmatites are generally found with quartz, or a type of quartz, that is a pearly white in color.

It is a cluster of ores, of various types, and the ores can be any thing from silver, to gold, to iron, to boron, or cadmium.

What is boron?

Boron is a chief component of the metal industry, and it is used for making steel. It is found in iron deposits, and it is also found in gold deposits. Boron is a chief component mineral ore found in iron ore deposits.

What is cadmium?

Cadmium is also a chief component of the metal industry, and it is found in large quantities, when found with silver ore, and with iron ore, and with gold ore, typically. It is a shiny grey ore, and it is very useful for making steel stronger.

The processes of melting tin ore out of cassisterite, is a difficult process, but the Lesbianists use it to help confuse people about what tin is. Tin is chiefly found in metal deposits, or metal bareing loads, where there is much iron ore, and steel ore.

Steel ore is similar to iron ore, but steel ore is stronger than iron.

Iron is a little brittle, and with out the use of steel ore, and with out the use of other ores, to stiffen it up, iron ore is a poor choice for durable, pots, and durable cast iron statues as it will fragment, very easily, and it turns to dust, if scraped with a strong hardened steel knife blade.

The home hobbyist, or workshop metal smith, as seen on PBS, the small sized smelting industry, as seen in a recent Las Vegas PBS program that touched on metal smithing, makes a big deal out of white metal, and that is iron, basically, the real brittle metal that comes in through the metal smith's doors from people who own statues made of iron. That brittle metal, if scraped with a knife, will start to shatter, and fall apart, and the metal smith was saying, he could not weld any thing to it, as it would just keep coming apart, layer after layer. That is iron ore, and it is different from steel ore.

I suppose the Lesbianists' made up the periodic table of elements to help confuse scientists, and it does not jive with reality, and the metals animals minerals animals, elements animals, and other animals, that we have in our environments. The Lesbianists periodic table of 'elements' does not help to describe the many types of 'elements' animals and other animals that we find in our environments, under the ocean, in the forests and jungles, under the ground, or in the deserts, and so on.

How Many Elements Animals Are There?

There are so many elements animals, you will take many years to study about them all, if you decide to study in depth about them. Maybe it will take several hundreds of years, to learn about some of the things about them. If you wish to study about all the mineral animals, metal animals, elements animals, and other living animals that are in my many universes, it will take you a far greater amount of time to study about them all.

We will have courses for you to study about them, once we set up our new civilization, and once we get around to setting up the many other new civilizations, that will all be patterned after our civilization, that we will be setting up, shortly, with the cooperation of the Lesbianists, the Zealots, and their many other outbound planetary settlement groups radical friends.

New Sciences

Elements animals are many types. There are thousands, and millions of elements animals, if not more, maybe many times more, into the kazillions, plus many times more, I think.

Just like animals on the ground, or in the ocean, or in the fresh water lakes, or in the sky such as birds, or in the lagoons, or in the swamps, and so forth, there are untold, countable numbers of different animals.

However, the elements animals are very far greater in number, than the animals we can see with our eyes.

Animals of all sizes, and some of them are very tiny, exist in huge numbers, all throughout my universe.

Tree animals, and plants animals, we learned about recently, the drafts babies, and the wedger mama's, they are in each and every plant, and they are different from every other type of plant animal.

There are quite a large number or plants, and flowers, and bushes, and sea weeds, though we don't see sea weeds too often, or kelp plants, but there are lots of underwater plants, but perhaps not as many as above ground plants, as we have destroyed our environments, and in the ocean, the oceans are so polluted, not much grows in them, any more.

Elements animals are very large in number. So are molds animals. Molds animals are very large in number, but who is there more of? I don't know, but maybe with all the different types of molds there are, there may be more molds animals, than there are elements animals, but it is a close call, I think.

But maybe not, as there are so many types of animals in molds, maybe the animals found in molds, are far greater than the number of animals found in elements.

Anyway, I suppose molds animals, if we look closely at all the different types of molds there are, with a microscope, will far out number the number of elements animals.

Never the less, there are a far greater number of elements animals, than the Lesbianists are going to let anyone know about.

Why is that? It's because they do not want to educate people about the real world we live in. They want to keep us dumb, and stupid, so they can laugh at us, or at least, as dumb and stupid to them, anyway, so that they can laugh at us.

Well, it is a pretty unpleasant situation, here, because we have to learn what science is, and we have to learn the real sciences, and not the phoney sciences the Lesbianists teach.

My memories are not good enough to even begin to teach any thing, but any way, we need some Lesbianists, such as George Bussey, or Clint Eastwood, or Morgan Freeman, and Liz Taylor, and Mila Jovovich, and Mrs. Barbara Bush, Jr., and Mrs. Barbara Bush, Sr., and Mr. George Bush, Sr., and Mr. Ronald Reagan, and Mr. George Bush, Jr., and their radical friends, to teach us the real sciences, along with the rest of the Lesbianists, or Zealots, all of them.

Not a lot of them will want to comply, with that, but we can get some of them to comply, if you make friends with them, and then invite them to your houses, and sexal with them, and make them your best friends, and your sexaling partners. The longer you remain friends, and the longer you sexal with each other, the more compliant they will become over time.

That's the best way to get the Lesbianists, or Zealots to become your friends and then have them teach you stuff, about molds, and science, that you didn't know about, before. As you learn about science, you will learn about making molds, using different methods, and then you can learn how to feed your body, and then you can learn how to feed all the organ animals in your body, a proper diet, and then you can live forever.

If your organ animals all get the foods they need, you will have many happy animals inside of your body.

Professional Moldists

Lesbianists are all professional moldists, and they all have the capability to teach people how to mold up any thing that is worth molding up. They study for millions, and billions of years, and even longer, in some cases. They get their professional degrees, and then they qualify for the outbound settlers' program, and then they go off to settle a new planet, that has not very long ago, recongealed, after it was last smashed apart by a passing sun, or large planet, traveling at a very high rate of speed as it smashed into it, or as it smashed into something, such as another planet, or even a sun, nearby.

That can be very catastrophic, and not many people will survive, and many planets in the vicinity, will shatter to pieces, when a sun or large planet is hit by direct impact, by a large size planet, or fragment of a large planet, or a sun, or fragment of a sun, traveling at a high velocity, near or even past the speed of light.

The shock waves that go shattering out, in wave after wave, will destroy every planet and sun, for a long ways around.

This happens, some times, and the planets and suns and moons, are reduced to dust particles, and after some time, they begin to recongeal, as they go spinning around due to magnetic waves that affect them. After spinning in various formations of circular movements, they eventually recongeal into numerous planets, and many different sized suns. Lots of moons also form, and you have the birth of a lot of new planets, that need settleing.

We always send out people to settle the new planetary systems that need settling, who are most qualified, to establish and lead a new civilization, that they must construct, as a part of their agreements, for their being selected to settle the new planets.

This is how it is typically done, and so we get the best and the brightest, and after their certification, they go out to settle a newly formed area of planets that are habitatable.

We send out many groups, one after another, of highly qualified people. Hulk Hogan was one of those people, who came in a different group of people, but he is friends with the Lesbianists, and he supports, more or less, what the Lesbianists are doing. There are a lot of Hulk Hoagan's friends, who also came and settled this planet, in one or more of the out bound planetary settlement groups.

We need Mrs. Barbara Bush, Mr. Hulk Hoagan, and all of their friends, including Hillary Clinton, and Mr. Obama, to get into compliance with the terms of their agreements, that they initially signed onto, and penned their names to, so that we can get further aide from my children.

My Working Children And Where Are They?

My working children take care of the support work, once the settlers in the out bound settlement groups are in agreement with the terms of compliance, of their out bound planetary settlement program.

How this is done, takes some explaining, but it is fine to leave it as it is, for now, as it will take a lot of explaining to do, to let you know exactly how every thing in my universe is set up, and where all my kids are living.

There are multiple dimensions to this universe, and I weaved together this universe, in such a way as to support the activities of my kids, and at the same time, support the activities of other groups of my kids, living in different dimensions, and at the same time, support the activities of us, living here, in this large universe of ours. This is the central area for us to live, and we have a different job, as it turns out, and that is to purify our universe that we live in, for eternity, so that we can all live in all the universes I have made. There are many universes, too small for you too see, as you are just too big to possibly see them.

I also made many dimensions, and weaved every thing together, in such a way as to support the religion that I am now going to teach to you, over time, and that you are all going to learn about. You can decide for your self if you wish to practice my religion or not, but your practicing my religion, is essential for us to have a nice place to live in, for eternity. That also includes all of my kids.

Different Jobs For My Different Groups Of Children

We have a lot of different jobs to do, my kids, and you, and to keep every thing running smoothly, we must practice my religion, that I am now begining to wake up to and learn about, as I come out of my condition of amnesia, and that I am now begining to practice, in my apartment.

This is how I planned, it, with me waking up, and coming out of my amnesia, and then, over time, introducing my self to all of you, as you all begin to practice my religion.

We will be here for eternity, and it is our job to purify our universe, and to erase the karma, that is a continuous problem, for all of us. There is much we must understand about how my universe is built, maintained, and run or managed. All of my kids make karma, and to keep this universe running properly, we have to divide the karma up, into manageable sizes for each one of us to bare. We are in the best location, here in this universe that we live in, and it is our responsiblity, because we it is our job, to keep our universe pure by practicing my religion.

Advantages To Living In This 'Central Bus Station Terminal Building' Universe

There are lots of advantages to living in this universe, the 'Central Bus Station Terminal Building' universe, that my kids do not share with us, as they live and work in their many, tiny 'Bus Station Terminal Building Support' universes, to support what we are doing, in this 'main' universe. There are lots of things that you can do in this 'main' universe, efficiently, and effectively, that you can not do as well at, in the tiny universes that my kids live in.

The list is long, but one thing is, taking karma, and figuring out how to deal with it, and then dealing with it, efficiently. Another thing is, balancing out karma. We need to balance out karma, to keep every one and every animal alive, thriving, and well, and we can effectively balance out karma, in this 'main' universe, better than in the tiny universes that my kids are living and working in.

With my religion, that we will begin, soon, to accept and practice, some of us in our universe, and in time, more of us, and with my kids practicing my religion, along with us, but in their support network of tiny universes, and more needs to be explained about the support network of tiny universes and what my kids are doing, as they work in them for keeping things running smoothly and harmoniously, we will effectively have a way to balance out karma, much better than ever before.

Practicing my religion is also good for erasing our karma, and we can more effectively erase our karma, and keep things running smoothly, for our 'main' universe, as well as for all of the many support universes, that my kids are living in and working in, and that we need integrated with our 'main' universe, to allow us all to live in this very big universe of ours, which includes and is central to all of the other many 'tiny' universes and central to all of the other living areas, that goes on, beyond the walls of this universe, in all directions for almost nearly infinity for all practical purposes, that I have for all of my working kids to live in and work in, supporting what we are doing in this universe and supporting, in an inter networked and inter connected manner, what they are all doing, in their universes, and living areas, as well.

My human being kids all have jobs, and so do all my worker animals, and I have lots of working kids, and I have lots of worker animals of all different kinds.

You and I, who are in this main 'Central Bus Station Terminal Building' universes, are the only ones who do not have jobs assigned to us. Therefore, we are all going to work, forever, from now on, at practicing my religion, and this will be our primary job, for keeping our universe running, and for keeping all of my kids universes and living areas, running in proper order, as we erase the massive amounts of karma that need to be erased and as we balance out the massive amounts of karma that need to be balanced out.

This is a difficult and lengthy topic to discuss, and so I'll have to leave it for another day. Sorry.

In any case, we all must have a job, all of my kids and I, and now, of course, you are all going to join my kids, whether you like the idea of it, or not, and begin working for me.

Getting Into Compliance Of The Outbound Settlement Program

Mrs. Hillary Clinton, Mrs. Barbara Bush, Jr., Mrs. Barbara Bush, Sr., and all their friends are now going to have to get into compliance with the terms of their aggreements for the outbound settlement program. Once they do that, we can begin to get things started, for the rest of eternity, with you practicing my newest religion.

This religion will take the best from each of my earlier religions, that I taught, and combine all of the best of them, into this one. There are also some other special features to this religion, and we'll learn them over time.

In any case, we are going to place women in their rightful place, above men, and we are going to place men in their rightful place, below women. That's one of the main things that we are going to achieve with this new religion. It was never a big issue, before, in I think maybe most of my religions, if not almost all of them, where women stood in relation to men.

Anyway, we are going to get an understanding of the fact that there are two races of people, and one of them is the female race, and one of them is the male race.

That's one of the primary things, that we are going to get straightened out, now, with my religion, with out ever getting it confused, again, for the rest of eternity.

In any case, we need all of the friends of Hillary Clinton, Bill Clinton, Chelsea Clinton, George Bush, Jr., Barbara Bush, Jr., George Bussey, Mila Jovovich, Bruce Willis, and of Hulk Hogan, and of all of the other people who came in the original outbound planetary settlement groups, who are still here, and still alive, and who still remember that they all have planetary settlement agreements to get into compliance with.

Unless they do that, there is not much we can do, except wait around until they finally do decide to get into compliance. They must then take the neccessary steps to inform every one, about the facts of this situation.

The Planetary Government And The Laws For The Citizens Of This Planet

Until they do that, we can not get much work done, as all the laws, and the way the societies on this planet are set up, will not work for us. Nudity and nakedness must be permitted, and so must public sexaling. All forbiddance laws must be dropped, and all laws on behavior, and the types of plants people can eat, and so forth, must be all dropped.

The sets of laws that are the basis of the outbound planetary settlement programs must be then instituted. The governments that the Lesbianists have set up, must be dropped, and one planetary government must be formed with those laws as the foundation for all of the citizens of the planet.

Those are the first steps that we must take. After that, we will get and have the needed arrangements, to set up my religion, globally, so as to make it accessable to every one.

We are also waiting on the release of the software and operating system, that I released to the FBI, through their twenty four hour a day, audio and video surveilance of me, which I've talked about, before. When that software and the operating system are released, we can begin the 'managing my universe' program, and the 'sexaling for a living' programs, that will then be instituted, after the Lesbianists and their friends, get into compliance with the terms of their agreements.

Once they get into compliance, and once we get the software from the tapes of the video surveilance, we will be able to institute the 'managing my universe' program, and the 'sexaling for a living' programs.

Until then, there is not any hope for any meaningful change. So, until then, please make friends with the Zealots, or Lesbianists, and their friends, and become good sexaling partners with them, and get them to teach you more about the real sciences, and about molding sciences, etc., and make good relations with each other. It may take some time to get their attention, and to get them to begin to accept your offers and invitations to your homes, or to their homes, on occaision, for sexaling sessions. After sexaling for several weeks, non stop, they will all become more pliable, and more compliant, and they will begin to loosen up, and then open up and talk about things, as you all begin to learn to trust each other, and to treat each other with care, consideration, and respect. You can then begin to build on your understanding of each other, and your relationships with each other, will begin to blossom.

Sexaling Professionals

The Zealots, and their friends are professional sexalers, so they can teach you many things and secrets about sexaling, that you may not know about. You will make good bed partners, and after some time, you can learn lots of things. There are cures for herpes, of course, and for genital warts, and for all venereal diseases, and so forth. These

Zealots, the Lesbianists, know all about them, as they had to study all of that stuff, to get qualified and certified for the outbound planetary settlement programs. You will also be able to learn proper diet techniques so as to be able to feed your body, and all the organ animals, and other animals, that are living in your body, and that you need to feed. You can also learn proper skin care, health care, and body hygene.

Wedding Arrangements

Currently, the way things are set up, with one person, a male, and the other person, a female, getting licensed to marry each other, will not work, under the new system. Thus it is neccessary to get into compliance with the terms of the outbound planetary settlement programs, so that the new laws will allow for multi person marriages. Multi person marriages, I discussed, before. Women and girls need multiple men and boys to sexal with, properly, as women and girls are very capable sexalers, once they learn how to sexal properly. Multiple person marriages will allow for mulitiple women and girls, and multiple men and boys, to marry each other. The current laws must be dropped, and the current governments must be disbanded. After that, the new government and the new laws will allow for multiple person marriages. Once multiple person marriages are allowed, after the new government is set up, then the sexaling for a living programs, will be instituted, as a part of the compliance terms.

Informing The People Of This Planet About The Terms Of Compliance

The Lesbianists need to inform every one about what the terms of compliance are, and they had better get to that, soon. They must then, with their many friends, who came after them, or along with some of them, as they arrrived on this planet, by space carrier, or space ship, begin to get their Lesbianists friends in all the governments of the world, and their other friends in the governments of the world, to comply and participate in setting up the one world planetary government.

The software and operating system software, have in them, access capabilities to access data bases, to down load all of the information, that is needed for every one to learn about and to begin participating in all the new programs.

Building The Infrastructure, And The Needed Facilities, Etc.

Once you begin accessing the databases, and once you begin to study, and learn about the new programs, my kids, who work in other universes, and in other dimensions, will then begin to build and set up the infrastructure, housing, food production facilities, medicine production facilities, recreational facilities, academic facilities, hospital facilities, prison facilities, and so forth, that will be needed to further advance the programs every one will be required to begin and will need to begin to participate in.

Once we get to that point, we will begin to be able to have a stable society, with all of the new technologies that will be provided for security, and personal safety.

Molding Up Bread And Metals Animals, Etc.

I said, before, that you need only a square inch or so of metal in each one gallon of bread you are molding up. That may be a minimum, but it is better to use more. If you are using a plastic container, you can line the bottom of it, with aluminum foil, and you can line the in side walls of the container, up to one half to two thirds up towards the top, for better results.

Some molds animals like silicas. Some like quartz. Some molds animals like tourquoise. And lots of them, like various mixtures of minerals and metals, and elements animals, as well as other animals, we do not know much if any thing about, who are hiding inside of rocks, and stones. Anyway, we'll find out, in time, all about what molds animals we are trying to make, and what they like to eat, and then we will find the right types of rocks, ore rocks, mineral rocks, and other types of rocks and stones, and we will provide them to the molds animals, and funguses animals, so that they can get fed well. The more well fed we feed them, with all of the many types of worker animals of mine, the healthier they the molds animals and funguses worker animals of mine will become. The more healthier they become, as we raise them, in the containers we find to farm them in, when we are finished farming them, and then when we eat them, the more healthier the organ animals in us, will become.

The more healthier the organ animals in us become, the better able they will be to make babies, and the more successful we will be at prolonging our longevity. Our bodies are meant to last for eternity, if we feed them with the right worker animals of mine, and all the proper foods and nutrients they need to stay healthy. We have much to learn about all of this, and the sooner you begin making friends and making sexaling partners with the Lesbianists, and their radical friends, the sooner you will be able to begin to understand how to feed your bodies, properly, so that you can begin to live forever, and so that you can begin thinking about working for me, in this main, Central Bus Station Terminal Building that we are living in.

What Will Be Your Main Jobs From Now On?

It might take you awhile to decide to begin working for me, but the sooner you decide, the better off we will all be, as we need all of the wonderful sexaling energies you and your sexaling partners will be helping to create, to fill up this universe of ours, and to fill up all the many universes of my kids, and all the living areas of my kids who live outside this 'Central' universe we are in, which is a very big place, as I've mentioned about, before. It is very hard to fill up this 'Central' universe we are living in, with all of the wonderful sexaling energies, that will allow us to begin to breath, easier, once again, and that we are starving for, and that we are currently depleted of.

We will, though, over time, fill up this whole universe, and all of the many other universes, and areas my working kids live in, with all the needed sexaling energies animals, and other types of energies animals, we do not understand too much about, and that we also have to study about, one day.

My working kids are all doing their best, sexaling for a living, so that they can erase their karma, and balance out their karma, in addition to working at their main support jobs.

Those of us, you and I, in this main, 'Central Bus Station Terminal Building' do not have any support jobs, so we will have lots of time, for the 'managing my universe' programs, and for the 'sexaling for a living' programs so that we can also erase our karma, and balance out our karma, as well as erase all of the karma of my worker animals, and also, help balance out all the karma of all of the worker animals of mine.

That is your main 'job', from now on, sexaling for a living, as well as working in the 'managing my universes' programs.

We will have lots of time to study about every thing we need to and want to study about, so we can better understand the many things we need to learn more about, so that we can appreciate what my working kids are doing, to keep all of the many tiny universes, and all of the living areas, as well as our universe, in proper working order so that you can all live and work forever, as one big family of children.

There is much more to learn about, with regards to my family of children, and about all the new human being kids we will be greeting, and welcoming into our large family, as the ladies and girls begin to bring them into our 'Central' universe, as tummy mommies, along with the tummy daddies, and we will learn more about the many new working kids of mine, that my working tummy mommies kids and working tummy daddies kids, will be bringing into, and welcomeing and greeting as they come into each of their universes and living areas, another day. We will also be seeing many new worker animals of mine, over time, as many, many new ones, of all types, will also be joining the working force of my worker animals.

Getting Busy, Cleaning Up, In The Gurkian Age

It will take us a long time to get every thing into good order, and to clean up our universe, and erase our karma, and balance out our karma, along with my worker human being children, who are all busy, cleaning up the many support universes that they live in, and cleansing their karmic records, etc., and who are all busy, cleaning up the many support living areas, that they live in, and cleansing their karmic records, etc., as they begin to practice, more and more, my new religion for the Gurkian Age that we are now in and at the begining of.

This may sound hard to believe, or 'fictious', but it is not 'fictious', and over time, you will learn all about every thing in detail, and you will begin to get your selves grounded in reality, more and more, as you begin to work in the 'managing my universe' programs, and as you begin to work in the 'sexaling for a living' programs.

Taking The First Steps Towards Resolving Cooperation Issues

Making friends and becomeing sexaling partners with the Lesbianists, the Zealots, and with their radical friends, is your first step in the correct direction towards resolving the difficulties we are encountering, now, to some extent, because of the Lesbianists, and their radical friends reluctance to cooperate. The more friends you make and the more sexaling partners you make, the more the Lesbianists and their radical friends will begin to 'cooperate' with you, in all the ways that are important to resolve the cooperation issues, and non cooperation issues, that are currently in need of resolving.

Air Raid Shelters And Play Time 'Fetish' Sexaling Underground Dungeons

People with underground air raid shelters, may wish to add on to them, and expand their size to accomodate all the new friends from among the Lesbianists, or Zealots, and their radical friends, who people with underground air raid shelters, or other convenient places, underground, such as play land dungeons, which some people who like fetish sexaling, may have, will be inviting in to their underground air raid shelters, for a long duration stay to have the Lesbianists, or Zealots, and their radical friends, teach them about sexaling, and teach them about molding, and the sciences that these people know nearly every thing about. Almost one hundred percent of the course work had to be completed, and in many cases, it was one hundred percent of the course work that needed to be completed, to make them an eligible candidate for an out bound planetary settlement program.

Becoming Trusting And Loving Friends With Each Other

As you invite these people into your homes, you will need proper accomodations, such as extra rooms, and extra beds, and so forth, so people with underground air raid shelters, and with underground fetish sexaling rooms, or dungeons, will need to expand the size of these underground rooms, so as to accomodate all of the guests they will be inviting in, to meet and sexal with the family, the relatives, the neighbors, and other trustable persons.

You can learn many secrets about sexaling, and you can learn a lot more, than you would imagine, as all of these people were certified as instructors for teaching sexaling techniques, judo and ai kido techniques, as well as impromptu ninja type, assasin techniques, for use in a pinch, to protect their lives. They were also certified to teach molding sciences, and all the earth sciences, and planetary science, all the math sciences, and so forth. They were also trained in government sciences, nutritional sciences, medical sciences, and so forth, so they could be all around, professional, well trained persons. All this training was for the bright of the brightest, and they spent many hundreds of thousands, and millions of years, and billions of years, and some times, more, training and getting certified in all the career sciences, as well as in fitness and health sciences, that they needed to learn to set up a new civilization, with a fully developed government, in accordance with the instructions and requirements for that government, which was to be based on the same pattern of government, where they trained to become certified officials on the planet they were to settle, and in the galaxy they were going into.

They were trained to be excellent leaders, and capable people, in every sense of the word, to get and hold the attention of all late comers, and to prevent the late comers from attempting to dislodge them, from government, over some petty, dissatisfaction, about their performance. Their performance issues were of major concern, so they were highly over qualified, so as to make it clear to all late commers, people who would be arriveing later, either as new additions to the population, on the out bound planetary expeditionary settlement program, or as tummy babies, to tummy mommies, and to tummy daddies, who they all new they were going to become.

They are so well trained, they can teach you practically any thing, not only with regards to medicine, government, the sexaling sciences, and so forth, but even about the martial arts sciences, and ninja sciences, and the techniques they learned, which they practiced, many of them, diligently. They can do some very fancy martial arts and ninja assasin tricks, if you ask them to, and they can be very entertaining as some of them are very adept, or skilled at performing these tricks, and secret martial arts attack and destroy skills. As a rule, in the Lesbianists organization, any way, they are only allowed to use those skills, in a life or death situation, so you should treat them, well, and be courteous, considerate, and kind to them, and make sure their stay is comfortable, and that they are well fed, and offered only the best foods, and the best wines, etc. They will help you to learn how to make good tasting wines, which are not only good tasting, but also, good for you, which will help feed all the animals in your bodies, including the organ animals, so that you can regenerate and rejuvenate your bodies.

Of course, when they were in training, for the out bound planetary expeditionary settlement program, when they trained in the martial arts, and when they trained in the ninja sciences, they were certified, and got their diplomas, as well. In the guidelines, they are not allowed to use their ninja attack and destroy skills, or their death threat level, response and offense to attack and destroy an enemy, who might like to dislodge them, forcefully from government, and perhaps kill them, if they could, to get them out of the way, permanently, unless their lives are in danger.

So long as you do not threaten them, and make hostile remarks to them, and so long as you remain courteous, careing, considerate, and kind to them, and so long as the men and boys act in gentlemenly manners, and so long as the women and girls act with lady like, polite manners, to whom ever your guests are, you will certainly be able to get along with each other, without any problems, at all.

They were trained in the sexaling sciences, and in the molding sciences, and in all the academic sciences, so that they could also offer educational programs to all of the new comers, whether tummy babies, and off spring, the children of the members of the out bound planetary expedtionary settlement program, or whether new members, incoming from else where, who would like the additional academic training.

Try to get along as best as you can, and remember to be polite, and talk politely, and be courteous, and make every effort to allow them to enjoy the luxury of relaxing days and nights, fully sexaled, and fully fed, and allow them to make lots of aphrodesics molds, and other molds, as well as useful and tasty beverages, such as those they can make with fruits, and juices, and molds of various kinds, which will increase the amounts of nutrients in your body to help feed all the hungry animals, and organ animals, and cell animals, and amoebes animals, etc., who are all in your body, and who are all in need of nourishment.

Remember too, to always test feed the drinks to farm animals, such as pigs, hogs, goats, lambs, sheep, dogs, cats, and so forth, including other animals, such as guinea pigs, mice, rats, ferrets, and wart hogs, first, if your guests will not drink the beverages they make, for some reason.

We want every one to remain healthy, and happy, and there should be no toxic poisonings of the food and drink permitted, due to tricky knowledge of poisons the Lesbianists, or Zealots, and their radical friends, can make, with their knowledge of the molding sciences.

Make sure every one remains on the best of terms, and make friends with them, after sexaling with them, for several weeks, or longer, and when they begin to truly enjoy their stay with you and your family members, and with you and your family's relatives, and with you and your family, and so forth, and your neighbors who will be dropping in, every day, hopefully, to enjoy extended sexaling sessions, for days, and weeks, and even months, and even years, in lots of cases, as they haven't had the chance to sexal very much, ever since they all came up from underground, where they were living, and sexaling with all their friends, all the time, for their 'tour of duty'.

The Lesbianists, i.e., the Zealots, and their radical friends, must perform a 'tour of duty', every so often, to stay in good standing within the organizations they belong to. They plan these tour of duty trips to the surface of the planet, to engage the locals, the ordinary folks, the dim witted folks or rodent population, as they call them, well in advance of each tour of duty. We ordinary people, are the dim witted folks, in their view, and they enjoy making fun of us, and making fools out of us, as much as they can, for their amusement. We shouldn't mind this, as every one needs to have fun, once in a while. So be gracious hosts, and invite many of these people, freely into your homes, and treat them almost as you would treat the members of your family. Remember to sexal with each other, daily, as much as possible, when time permits. Have lots of friends, and associates, all trustable people, come to your homes, to meet your guests, your 'new' family members, and have your trustable friends engage them in pleasant conversations, and in lovesome sexaling. Lovesome sexaling, is passionate sexaling.

You can find their likes and dislikes, as to who or which type of person, male or female, and so forth, each new guest likes to sexal with, as a preference. Make sure that every one is compatible, with each other, in terms of their sexaling preferences. As time goes by, you will all begin to love one and another, and then the issues of non cooperation, will fade into the past, and into ancient history, and we will eventually get full cooperation, on all the points neccessary, for then setting up a one world, planetary government, with their kind assistance. They will be happy to teach to you the terms of compliance, once you become cherishable, loving, and tendersome friends with each other, as you sexal with each other, daily. Tendersome means, loving and caring towards some one.

In time, when you have begun to break down the walls of hostility, some of them may feel, for being guests, against their wills, some of them, anyway, will never the less have some tiny amounts of hostility, for your bringing into your homes these wonderful people, despite their busy, daily schedules, and rigorous duties, or routines at work and on the job, in government, or in the field of academics, and in television, as news casters, weather reporters, anchor persons, camera men and women, and stage and screen acting jobs, and stage hand jobs, from police departments, fire departments, ambulance attendants, doctors, lawyers, ad agency workers, and so forth, or in what ever the work they are doing, during their tour of duty.

As you, the hosts, gradually break down the walls of antagonism, unpleasant feelings, and hostilities some may feel towards you, or resistant feelings that some may have, when you invite these people, your new 'family' members, or guests, into your homes, as you sexal with each other, the longer you sexal with each other, sooner or later, you will begin to be able to love and trust each other.

When you are able to love and trust each other, and when there are no residual hard feelings, or unpleasant memories left, when you all love to snuggle and sexal with each other, having lots of fun and laugher with each other, then you will want to begin to get the shopping lists of delicious foods for them to eat, and you will want to get the shopping lists for the items, that they will need, to make the delicious molded foods, and the delicious snacks, given their incredible know how on making delicious foods, and delicious snacks, and delicious beverages, based on all their academic learning, training, and teaching, that they acquired over the many long years of study, public service and volunteer work they performed, to qualify for the out bound expeditionary settlement programs.

In time, you will all be able to regenerate your bodies, look younger, feel great, feel more fit, and your stamina for sexaling will have improved, if you follow their advice and tips on how to improve your sexaling methods, and your sexaling techniques. As you listen to them, and learn from them, you can level up your sexaling sciences knowledge, along with your sexaling skills. In time, you will also be able to learn all about the molding sciences, and you can even have them teach you some of their 'sneaky' tricks, that they know, that could kill you, if they were allowed to mold up, any thing they wished to mold up, without supervision.

Remember, a loving relationship is not the only thing needed to build a trusting relationship. Understanding, respect, and careing for each other, all go a long way towards helping you to deepen your trust with one and each other, so that you can deepen your tenderness towards each other, and strengthen your bonds of love, for each other.

Supervise carefully, every thing they do, and remember, if they will not eat or drink what they make for you, you should test feed it to the pets you have, as I've explained about, before, for several weeks, as there are fast ways to poison people, and there are slow ways to poison people.

This is a very difficult area to manage, but once your guests, your new 'family' members, begin to show true love and affection, and unflattering love for you, and for your family members, and for your friends, etc., with respect for you, your family members, and for your friends, along with care, consideration, and understanding, these problems will become less of a threat to having a happy and mutually cooperative, and prosperous relationship with each other.

Unflattering Love

Unflattering love, is a type of love, where you accept each other, for who you are, with all your faults, and frailties, no matter what they are. It's like a brother and sister relationship with each other, with love and respect for each other, no matter what.

In time, you will develop your love relationship into one of unflattering love and affection. When you have succeeded at that, then the hazards, one may encounter, as hosts to your guests, may become a tiny bit, less serious.

It takes many years of cooperative association, many thousands of years, and then, even more, before you will develop any thing that is worth while between you and your guests in so far as being able to trust each other. So prepare well for the long term long haul journey ahead of you, as it will take you millions of years, before your guests, even begin to calm down, a little. People are very good at hiding disatisfaction, and disgruntlement. They can linger, and they will linger, until they find a way to express them selves. You need to be cautious, at every moment, and suspect every thing that is in any way, suspicious or ambiguous behavior. Even after billions of years of mutual sexaling with each other, there may still linger hard feelings, in some people, if not in many people, for having been forced to experience, a sudden change in life and in a sudden change, forced upon them, in life style.

The Importance Of People's Rights To Freedom And Their Rights To Freely Choose The Course And Direction Of Their Lives

Being forced to cooperate is not a pretty issue and hard sentiments will linger for a very long time, if not handled properly. Counseling can help, but basic freedom is what is expected, and so until or unless you give your guests, complete freedom, to act and think, and do as they like, there will be problems and head aches for every one, with minor issues, possibly causing, major catastrophes, such as an early death and a visit to my Epcot Center, from an over dose of too potent, lethally potent, molded up substances.

Freedom, denied to a person, is the worst thing that can happen to some one. Until your guests can experience life, freely coming and going, as they like, and as they choose, voluntarily helping you and your family, and your friends, out of love and respect for each other, to learn the sciences that you need to learn to allow you to feed all the hungry animals inside of your body, and to feed all of the hungry organ animals, and cell animals, etc., inside your body, so that you can begin to live forever, you will experience difficulties in your relationships with each other, that will now and then appear, and cause possible problems for you, your family, your friends, and also for your guests.

Freedom to choose is a basic right of all people. So let's all be kind and loving towards one and each other, and over time, you will begin to be able to loosen the restrictions on personal freedoms, and in time, you will be able to do away with them, and dispense with them all. This will be a major turning point, in your relationships with your guests. When your guests can come and go, with unrestricted access to your home, just as a sister or brother has, to their home, and when your guests can freely choose what they wish to do, without any coercive forces placed upon them, then you will be making a major turn in the direction in which you all wish to go, towards a happy, healthy, settlement, over past confusions. With this as a goal for you, you should cooperate with each other, and make life as easy, comfortable, and satisfying as possible for your guests, to minimize their possible hostilities towards you for your forcing them to get into a situation of cooperate or else. This is not a good thing, and you will not get any cooperation, at all, if you approach your relationship with each other, with that attitude, and with that approach. A long, dependable, reliable, and mutually enjoyable, sexaling history with each other, is the begining of a trusting and loving relationship, that will one day lead to the loosening of restrictions on personal freedoms.

Captain Off The Bridge.

Molds And The Potential Dangers Of Potent Molds

Sometimes, you may have a mold on the bread that you are molding up, that may be too strong, and may need some trimming. As you mold up you need to trim your molds. What is trimming a mold? You need to make it more useful, by using various techniques, to make it edible, that is, eatable.

An eatable mold is what we want to make. We do not want to make a mold that is too strong in nickle animals, or too strong in copper animals, or too strong in iron animals, or too strong in stronthium animals.

What is stronthium? Stronthium, is a mineral that can be useful to your health, and is useful, but if it is too potent, or too strong, that is, if there are too many of my worker animals making gardens with lots of stronthium in the plants, and bushes, etc., and the number of gardens increases, and they my worker animals cover the whole piece of bread with their gardens and forests of stronthium rich plant life, then the piece of molded up bread, if you eat it, may make you ill, and vomit, or you may get cold chills. If there is too much stronthium, then you can even get seriously ill and die.

This is true with any molds gardens that my worker animals make. There are secrets about how to make molds gardens, and how to get the right number of worker animals, from the right sources, onto the piece of bread that you are trying to mold up. Different worker animals from different sources, will be busy making molds gardens, and you want to try and get right combination of my worker animals onto your bread, so that they can make you a nice salad of molds gardens of many different and useful kinds so that your salad will be healthful for you to eat.

You need to know a little about molds, and what types of molds grow on bread. You also need to know what types of molds grow if you put, for instance, lima beans with bread, in a canister or molding pot, and the pot is made of copper, instead of steel, or iron, instead of gold or silver, or lead,

You have to study about molds, and you have to learn about all the different molds. This can take many long years. You need also too know, what in combination with what, will produce what molds.

Lima Beans And Molds Types

There are many millions of combinations that you can make. Lima beans is one with bread. Lima beans grown in Peru is another. Lima beans grown in Alaska, in a low lying valley in Alaska is another possible combination. Lima beans grown in a snowy mountain village, in the summer, but in a green house, with a hot springs water supply, and geothermal, and hot water sulpher springs heating is another combination. Lima beans grown in Siberia, in a snowy mountain village, in the summer, in a green house, with a hot water supply, and geo thermal, and hot water malaxacite springs heating, or iron sulphide laden hot water heating, are two other possible combinations.

Worker Animals Living In My Universe

There are many millions of worker animals families in different parts of the world, who will each work on different lima bean plants. The worker animals all have different friends working with them. Many of the workers are different all together, and maybe they came from other planets, even, and settled on this planet, when they got a ride on a person's pant leg, or on a person's shoe, when that person came to this planet.

You can travel by air plane to different countries. You can also travel by air plane, to some planets, if you know how to make an air plane that will travel up and through the upper solar atmospheres, and out into the areas between planets, at a fast enough speed, so that it can pass through a dimensional barrier, and then in a different dimension, it can fly wihout hitting objects, directly to the planet the passengers wish to go to.

Special Automobiles That Travel Through Space

Some types of auto mobiles, which have special technologies, also travel through dimenisional barriers, to other planets. They have the technologies, to be able to get a lift, up and out of the planet's gravity pull, and then out onto a platform, landing and take off space. Once okayed for a take off, it can go to the next platform, and then to the next platform, and it finally reaches the final platform, and then it gets the okay to land on a planet, and it comes in, and it lands on a landing strip, and then after passing security and customs, it is free to drive to a person's house, or to an opera concert, or to a theater to listen to a symphony concert. Lots of people travel this way, in many parts of our universe.

When people, land, they bring all kinds of rubbish, with them, including lots of air, from their lungs, and from inside their automobiles. Inside the air, there are lots of tiny bugs, that crawl around in the bronchial tubes. Inside the tummy, there are lots of animals that crawl around in the tummy, and some of them, end up getting pooped out, when you go to the bathroom.

Bugs, Bugs, Every Where

Lots of times, little bugs, of all kinds, may find their way into a package of flowers for a girl friend, or chocolates for a boy friend. Or some times, people exchange, rasberries, and strawberries, and other types of edible foods, that are eaten, and pooped out, and then, the remains are thrown out in the garbage can, and then later, the trash company comes and picks up the trash, and they go to a compactor site, and they make use of what they can recycle, and they mulch up what they can mulch up, and they dismiss the items, they can not have on their planet, that are toxic, or that are not allowed on their planet, for one reason or another.

Many bugs travel from one planet, to another, in cars, in strawberries, and in groceries, that people pick up on other planets, and carry home, to their planet, to eat at their homes. This is perfectly legal, and every one, knows about it, and they are all laughing at me, because they all can read what I am typing, as I type. They have the technologies to read directly what I am typing on my computer, and that is nothing, special, as far as technologies go.

There are no laws that say they can not watch what I am doing, when I am sleeping, or when I am in the shower, or when I am dressing, or when I am typing, or when I am out side, walking to the store.

There are no laws on privacy, as privacy is a myth. We think we have a right to privacy, but remember, all you girls and women were married to all the men and boys in the universe. All you men and boys were married to all the women and girls in the universe. You were all sisters and brothers with each other, umpteen who knows how many times. You were all fathers, and mothers, and you tummy mommies gave birth to every person in our universe, all your sisters and brothers, from previous lifetimes. All you tummy daddies, also shared in the work with the tummy mommies. Every one knows every one else, and every one has been butt naked with every one else, umpteen countless times. So, privacy is not an issue, any more, as you all know what you each look like, when you are butt naked, or sick in bed, or in the hospital, and so forth.

Any way, many bugs travel from planet to planet, and there are lots of bugs, that may have gotten here, from the past, as the Lesbianists always have friends visit them, and their friends from other planets bring gifts for them, and they bring lots of produce, and things to grow, and this has been going on, since they got here.

How often their friends visit them, these days, I do not know, but some times, in the past, they visited them, often, and they have stopped, lately, as they do not want to get caught. They stopped about fifty five years, ago, and before that, they often met on some secret military bases, that all the soldiers on the base, are Lesbianists.

There are many military bases, that only Lesbianists are allowed to join, and allowed to live at. The Lesbianists have them all over this country, and all over the world, in fifty five places, approximately. Some times, even now, the Lesbianists have guests who visit here, but not too often. When they visit, they come in and land on the run ways, and in secret places, where they can glide in, at night, in special light carrier cruise ships, that practically glide in, from the parent ship, waiting up above. When they land, they land very softly, and quitely, and no one even wakes up.

They stay for a few days, to a few weeks, to five or so months, or even longer. They are here, now, and many are in hiding, with the Lesbianists, as guests of theirs.

They bring in bugs on their pants legs, and they bring in all kinds of micro scopic animals, and even tinier animals, and you do not have the technologies to see them, because they are so small, and because the Lesbianists prevent the 'ordinary' people from getting the patents and licenses, to build them, and they execute the patent owners, and any others who are part of the company or companies, who wish to build the microscopes, or other useful technologies, and that is that.

These animals that are very tiny, are living all over this planet, and there are millions of different families of tiny animals, that eat up each other, on the lima bean root and root stalk, and on the stalk of the plant, and there is much warfare on the plant, in very tiny places.

The out come, is there are many tiny animals, eating other animals, and pooping and peeing wastes from their bodies. Their poopy materials get into water and the air, and onto the roots of the plants, and onto the stalks, and onto the leafs, and we have lots of different kinds of tinier animals, that eat up that poopy material, and those pee liquids, and they live on that stuff, just like pigs live on dung from cows and from horses, and how flies live on dung from cows, camels, horses, bears, dogs, cats, humans, and so forth. There are lots of animals, we can not see, at all, because they are too small, and because we do not have the microscopes, and the lenses, and viewing technologies needed to see them.

The lima beans in different parts of the world, all have different groups of animals living on them, when they are picked, and when they go to market.

When you take the different families of animals living on the lima beans, and you have a handful of lima beans, you can put them into a container, that is lined with one or more layers of aluminum foil, and then you can put into the container, rocks, gravel - if they are clean - and pretty amethysts, quartz stones, agates, opals, garnets, and other pretty mineral stones.

You then put into the container, some bread to mold up. Depending on where your lima beans where growing, and depending on who was working, from among my worker crews of worker animals, on the roots of the lima bean plant, and on the lima beans, and in the leaves, and so on, you will get different poopy materials, and different types of pee liquids, and in the poopy materials, and in the pee liquids, there are lots of other animals, that are very tiny, and difficult to see, without the right technologies that will let you see them.

You can have millions of different molds gardens, from lima beans, with bread, in a container, as a result of all the different crews of worker animals that I have working in the soils, in the rocks, in the air, in the water, in outer space, on each planet, and on the moons, every where, with lots of them all mixed up, with one and another. The different animals living in the rocks, or in the aluminum foil, or in the walls or on the surface of the container, will also increase the number and types of poopy materials, and of pee materials that mix in, and help produce different types of molds.

There are so many possiblities, just with lima beans, there are more than millions of molds that are possible. When you think, well, there is also sessame seeds, and there are walnuts, and almonds, and pecans, and cashews, and figs, and fruits of all kinds, and seeds, and berries, and leafs, and roots of plants, and different plants, on land, and in the water, in lakes, in streams, in seas, in oceans, then you begin to see that the number of possiblities for different types of molds, gets very high, as I have so many worker animals, working in different places, they make me dizzy, when I think I would like to count them all.

It takes too long, to count them, but the important thing is to know, that there are many types of molds that can grow, just from lima beans.

When one mold begins to grow, another mold also will begin to grow, and so will many other molds begin to grow. One type of mold may grow in one part of the bread, and other types of molds may start growing in other parts of the breads, after you leave the lima beans, in the container, just for a few weeks, and you make sure there is enough humidity for the animals inside, to get some thing to drink.

You do not want to make my animal workers go thirsty, or they will not work for you. So you have to learn how to be a gardener, if you want to grow molds, properly. More over, you need to learn a lot about tending plants. That is, tending the types of plants that grow in molds gardens. Since there are so many molds that grow, you will need a lot of time to learn all about being a gardener, for all the different plants that grow in all the various molds gardens that grow.

You will also need to study about all the different kinds of animals that live in the molds gardens. You will also need to learn, what kinds of molds gardens will grow near other types of molds gardens, or on top of molds gardens.

Molds Grow In Layers

Many molds gardens get over grown with other molds gardens, and they grow in a double layer, one over the other. Sometimes, they grow in three layers, and in four layers, and in five and in six, and in seven, and in eight layers. They grow in many tens of hundreds of layers, if you let them grow for a long time.

How many layers, can they grow in, well, it depends on how long you want to grow them, the soil conditions, the growing conditions, the humidity conditions, the weather and climate conditions, and on many other factors.

I don't know how many, you can grow, if you really try to grow a lot, but there may be quite a few of them, that will grow, and way to many for any one to count, in lots of cases.

Some of the layers of molds may be alright to eat, depending on what the molds are, but some of the layers may not be alright to eat. Some molds layers are not useful for people to eat, because they are filled with some molds gardens, that are better for tiny animals to eat. Some molds gardens are better for large animals, like pigs and hogs, to eat.

People can eat lots of molds gardens, but you have to study about molds gardens, and about how different molds gardens grow with other molds gardens, in one layer, after another, in a container, with different types of rocks, under different conditions, on the different types of bread, to know which ones you can eat.

Some molds gardens, will give people stomach aches, so it is good to learn and know which ones give people stomach aches, and which ones are safe to eat, rather than not know which ones are good for our stomachs, and for our bodies, and are safe to eat.

We do not have any courses on molding sciences in our schools. This is because the Lesbianists will not teach any one about molding sciences. Why won't they teach any one about molding sciences?

Because, they enjoy living a long time, alone, by them selves, and they like to watch us ordinary people, come and go, one life after another, back again, then gone after eighty or ninety years, then back again, then gone again, and they think it is funny that all the while, we never catch on to what they are doing. They make friends, with people who they like to make friends with, and they enjoy fooling them, and dumbing them, or making fools of them, and they enjoy finding out if the people they meet, were friends of theirs, in previous life times, and they find out who they were, by checking in special databases, they or their friends have access to, and then they confirm whether they knew them or not.

Most of the time, they can already tell, once they meet them, and hang around with them, for awhile, if they had known them or not, in previous life times, as they know so well the persons they usually meet, again and again, and the persons they've met so many times, who they know all of the personal habits of, and the likes and dislikes of, these people they used to know, that they can pretty much guess if they know them or not, this time, when they meet them, and after hanging around with them, for a little while.

What Do The Lesbianists Enjoy Doing?

They like to take your tax dollars, for one thing, so that you will support them, pay for their salaries, homes, vacations, their all expenses paid holidays allowing them to visit their Lesbianists' friends in politics, all around the world, showering them with lavish gifts, presents, round trip tickets to visit them in Alcapulco, or elsewhere, with all expenses paid, and they enjoy the perks they get such as your paying for their kids' college educations, and their kids' trips during college breaks to far away places, such as Portugal, Spain, Lisbon, Istanbul, Singapore, Korea, Japan, and other countries with your tax dollars paying for all the expenses, as well as all the expenses the Lesbianists need for doing the fun things they like to do, on their credit accounts, with various government agencies, set up to help them pay for their lavish, over seas' lifestyles, while they make fools of all of you.

They enjoy watching you fall for the scams they set up, where they saturate you with their talking 'experts' who tell you how to live your life, and what to invest your wages in. Then they like sending you, seemingly out of nowhere invitations to their 'specialists' talking tours, where they talk to you for a weekend or for a week or so, and they try to talk you into buying what ever it is they are trying to sell you.

They get close to you, this way, and they find out things about you, that they will use to track information on you, in the databases that are set up in my universe, that they or their friends can access, to identify you from your previous lifetimes.

They have a 'sexaling for a living' account, that they are allowed to use, and track their old friends with, to see how they are doing. They all arrived here, on this planet, on the 'sexaling for a living' program. They are still registered members, and they have access to databases, if they are still in good standing, and if not, they have friends, who can access the databases, if their friends are in good standing, and there is much abuse, and fraud, that goes on, and it is not punished, as my kids are recording it all, and in time, my kids will take action, and dispel them from the program, that means, kick them out, and not allow them access to the underground bunker houses, that my kids had put in for them, to live in, and my kids will make them live on their own with their friends, and not in the facilities that they were originally allowed to live in. Once they are tossed out of their special facilities they earned the right to use, as members of the 'sexaling for a living' program, they are forced to live in the down below, underground cities my kids built for them during their initial getting used to the planet and to it's solar conditions, and to it's other conditions, that they must aclimate them selves to, before they can safely emerge and begin living on the surface of the planet.

There are several hundred thousand persons, such as Boris Yeltsin, who has a registered fortress dwelling, as Boris Yeltsin, sexals for a living, still, from time to time. He and the others, are the only ones who are left, and the rest of them find accomodations elsewhere, or with friends, from time to time, in the underground bunker like homes. They do not have to worry as much about the abominated 'animal people', I've mentioned about, as the others former members do, who are no longer legitimate members of the 'sexaling for a living' program.

Note: I was told by my kids that the number of people who are still legitimate members of the sexaling for a living program, was several hundred thousand, on this planet.

Then, accessing the databases, they learn who you are, who you were in your past life times, and then they remember the many occasions they met you, and were friends with you, and they also remember all the unpleasant things that happened, that made them angry at you. They then plan their game for getting revenge against you for the mean things, or unpardonable things, in their twisted minds, that they remember your having done to and against them, and against their friends.

'Spokes Persons', And 'Experts' On Television

You can hear, on any radio station, probably, no matter who runs it, civilian, i.e., ordinary person or, Lesbianist, advertisements from their 'spokes persons', people with credentials, who like to tell you how to live your life, and what to do for getting the most out of life, as I can hear, daily, on KOAS, 105.7 Jazz, Las Vegas, Nevada.

These 'spokes persons' are on every 'propaganda' interview talk show on TV, and on other programs, as well, such as the supposed 'educational' series done by credentialized anthropologist, Desmond

Morris, a major Lesbianists' propagandist and they have set up programs where all they do is feed you bull shit, such as on PBS, the famous Road Show, where they are bullshitting you on and on, about what your 'priceless' family hand me downs, and possessions are worth, when they know they are not worth a dime, because these Lesbianists have been on this planet, for over gazillions of years, ever since they settled it, on the outbound expeditionary planetary settlement program, for qualified people in the 'sexaling for a living' program, who were supposed to set up a planetary government and a global society, and give birth to lots of my kids, by making babies, and then teach them in courses they were supposed to set up, every thing they had agreed to teach, and then educationaly nurture in the people who would come, as tummy babies.

The Lesbianists have set up so many civil wars, and other wars, for their fun, and entertainment, as they have many scenarios for their kicks, thrills, and enjoyments, and they constantly are changing the scenarios, every time their plans collapse, after their illegitimate societies fall apart for one reason or another, and they then have to start over again.

The societies do not always collapse, entirely, and some times, things going on in one part of the world, is very advanced, technically, while things going on elsewhere, are in the stone ages, nearly. They keep people away from areas that are not yet ready to be seen by ordinary citizens on the planet. They put out travel advisories and warnings issued by state department counselates, of chaos in jungles, and tribal militias, in rugged, untraveled areas, and so forth.

Mormon 'Peace Brigades'

This way, they keep people apart from each other, and they keep modern up to specifications people, people with 'worldly' or 'global' agendas and ambitions, such as private organizations that send out counselors to countries where people are less fortunate, than others around the world, from the reports they have seen, or from video images they have seen. They keep these 'do gooders' usually, a lot of Mormon 'Peace And Charity' bringers, the young men who go out, for a set period of years, to bring the 'gospel' into the 'lives' of 'non believers', from seeing the things they do not want them to see, such as technically advanced structures, none of the primitively living people in a mountainous, rugged area, for example, have any idea as to how it got there.

Soldiers Stumble Across Unexpected Sights, Now And Then

Soldiers sent on expeditions to fight with guerillas, find these technologically advanced structures, as they come across them, as they are searching out the area, for the 'enemy'. The soldeirs are warned that they are not to disclose any information on what they found, as it is too sensitive to let any one know any thing about, and their mouths are sealed, at the threat of retaliation for insubordination, sabotage, spying, or infringement against laws of engagements, the articles of war, that prohibit soldiers from disclosing enemy information, so as to keep it secret, for legitimate, in a normal society, purposes.

Historical Documents Found In Attics, And Shown On The PBS Program, 'Roadshow'

There are so many copies of treaties, and declarations of independence, not one of them is worth a penny, as the Lesbianists set each war up, and each society up, and they are laughing at you for thinking the documents actually mean something.

On the other hand, you can see them bullshitting you with their experts, who tell you how cheap something, is, or that it is a 'recent' creation, made, for instance, within the last fifty or so years, or within the last one or so nearly, hundered years, such as an irreplaceable lamp, with a beautifully made lamp shade, the creation of which, is worth a fortune, as it is so rare and so beautifully executed or made, and in fact, it was made umpteen millions of years ago, for instance, or even longer, ago, and they know it is worth a fortune, and they get nervous, a little bit, and they stammer, a little bit, and they get edgy, and they show signs of perspiration on their forehead, and you wonder why is the person so nervous.

Well, it is because that what they are looking at, they plan to tell their friends about, so that they can go and burn down the house of the owner, after killing the owner, typically, and after either destroying the item they found that the guest/owner brought into the studio, to show on the PBS program, the 'Roadshow', and get 'authenticated', by 'experts', or after killing the owner, and his or her family, and then stealing it, and keeping it for themselves.

You come around and go around, again and again, and you all have talents, and have always had talents, as you developed your abilities during past lifetimes, and once you got your abilities in a certain area of your interest, up to a certain level, it isn't hard to see how you take those developed talents with you from one life time to the next. It is just a matter of reviving them, if there is an opportunity for you to get into that area of your interests.

The experts crafts persons among you, make nice things, and then the Lesbianists trash your lives, and some of your work surfaces, some where down the road, at a time, later on, in some old attic, and no one knows how it got there, and it is something of great value, that just happened to escape the holocaust, that devasted the last civilization, or a previous civilization, the Lesbianists set up, and that went missing, and was of such exquisite compensense, and compensense means, nice looking and exquisite in form, texture, beauty, style, meaning, and composure, that they can't even hold their breath, because they are about to pass out, and they tell you it is worth a few bucks, or twenty or fifty dollars, and all the while they know they are bullshitting you, and they are nearly fainting, and when their friends see how well they bullshitted you, they will make their friends feel they are getting some kind of revenge against you, for your being so stupid, as to what is what, and what came from where, and who made it, and what it is worth, in true value.

The Lesbianists who run the program, 'The Roadshow', and PBS, regularly rate cheap items, as expensive, to some extent, when it is just a piece of rusted junk, such as a civil war sword, that some southern soldier had the unfortunate circumstances in his life, to go off and fight a war the Lesbianists staged for him and you other ordinary persons, to go and fight, so they could laugh at you, as you killed each other off, and bloodied the country side, with your torment, and grief, at their beckoning and call, all the while you thought they were worth a darn, and they weren't, all the while, and they were just interested in using you, and in making fun of you, and then having a good time, with what ever it was, that you left behind, such as children, who they enslaved, or houses, farm steads, and so on.

The Lesbianists have caused so much harm and devastation to so many people, and they just laugh at it. The ugliness of what they've done, is well documented, by my kids, and one day you will all get to witness it, your self, as my kids keep video data, and audio data, on every one, and on every thing that occurs, nearly.

PBS's 'This Old House'

The Lesbianists have their specialists talk to you on 'This Old House', for instance, or on one of the other propaganda programs they have, and they bullshit you, on TV, and their friends are watching, and they get laughs, and every one knows who they are bullshitting, because by the time the program airs on TV, they have already told every one among the Lesbianists who would be interested, with their secret communications capabilities, that they have installed in homes of important people in their organization, and that information is forwarded to other Lesbianists who they know would enjoy watching them bullshit you.

They televise their bullshit sciences, they created, and information on the supposedly important and famous people, who have passed away, for instance, and in one of their sick jokes, they bought or stole, or forclosed on his or her property, and then opened up a swank gallery with his or her work, and they keep it all for their viewing pleasures, and for their enjoyment, and they do not allow the ordiary people on the premises, unless a person happens to be invited by a Lesbianist, who is just going to enjoy some time, bullshitting the person.

They televise the 'visit' to the premises, gallery, or the estate on PBS TV, to tell you and 'teach' you some thing about the 'deceased' person, who was 'famous' for such and such, which they know is based on a numbskull science they taught him, or her, and what ever he or she actually became famous for, they bought for a meager sum, usually after swindling the elderly owner, or they forclosed on it, and then they enjoy it, with their friends, and they sort of taunt you, on TV, saying, look at this, isn't it beautiful, and too bad, but you can not enter the premises, without a special guest pass, and they broadcast this on a feature program on PBS, or on one of their other public broadcasting channels, over seas, the BBC in Britain, or NHK in Japan, and so on.

They are constantly mocking you, and poking fun at you, and making them selves laugh at how stupid you are, for not catching on, and for thinking it is something you should look at, as a serious viewer, when all the while, they are making fun of you and the snookering job they are doing on you, laughing at your stupidity for not knowing that the science involved, is a bogus science, and for your not catching on, and that they are just shamming you, or snookering you, once more.

They hold you up to these patriotic "I Pledge Allegiance" to the flag nonsense, in schools, and they couldn't give a darn about whether you are born in Scotland, or Queens, New York, or Paris, or Darwin, Austrailia, because they know, that no matter where you land, when you come back as a tummy baby, they or their friends around the world, will just continue snookering you, no matter where you are born, and no matter to whose family you are born.

They then send your son's and daughter's out on war and peace campaigns, where they make minced meat of you, as they force the soldiers to engage the 'enemy' in mock, to them, wars, and peace keeping campaigns.

Your son's and daughter's, if they are lucky enough to survive, come back from the wars, and from the peace keeping campaigns, and they are not happy with their experience, and there were many dreadful things that happened, such as being caught by the enemy, then tortured, or crippled. These are all made up wars and made up peace keeping campaigns, and it is set up to keep you busy, so that you will pay your taxes to them, for the 'important' things they do, to maintain 'peace' and 'stability' in the world, so that you can 'sleep' at night.

Getting Revenge Is What The Lesbianists Enjoy, Most

Most of all, the Lesbianists enjoy getting revenge on people who they dislike. They enjoy going out with their old friends, and they enjoy fooling them, and they remember the bad things their old friends, did once to them, a long time ago, and they never forget these things.

The Lesbianists then enjoy kidnapping them, and then they enjoy torturing them and their family members who they always knew as well, in previous life times, and who they always had problems and complaints with, as well, and they typically hated them as much as the people who they bump into, and become friends with, and after torturing all of them, then they enjoy eating them, and then they enjoy killing them.

They enjoy being able to take all the properties, and all the land that every one owns, making sure that they keep all the valuable property, as far as they are concerned, in their hands. That usually means, making as much of the land, public parks, national parks, wild life conservation areas, indian reservations, BLM land, or other publicly, or privately owned property.

They are a very foolish, stupid, fiendish, menacing, and evil group of dangerous people, the Lesbianists, and we have to stop them, now, as it is time for them to give up the game, and it is time for us to force them to stop pretending and lying.

Lesbianists Will Never Tell You The Truth

They will never stop lying, no matter, what. You can threaten them with death, all you want. That will not help, at all. They know how things work in my universe, and they are not at all afraid of torture, or death. The only way to stop them, is to either kill them all, or you can kill most of them, take over all the jobs they had, and then make friends with the ones who are left, after you finish killing as many as you can.

You can start killing them, if you wish, by killing Hillary Clinton, Bill Clinton, Jeb Bush, the two George Bushes, the two Barbara Bushes, all the congressional members of capital hill, who are Lesbianists, and then all the important cabinet persons, of the White House, and department heads of all the important departments of the U.S. government. You'll have to kill most generals, admirals, and commanders in the military, as most of the military leaders, with a few exceptions, are Lesbianists. Many of the state National Guards are nearly all Lesbianists, so you'll have to get rid of as many of the commanding officers and soldiers of the National Guard as possible.

Stopping The Lesbianists, Please Detonate And Destroy All The Airports The U.S. Congress Members Use

If you happen to be in Washington, D.C., please blow up Washington National Airport, now named, after former President, Ronald Reagan. That will make it hard for the Lesbianists to travel. They will have to go to Dulles International Airport, or to another smaller one, nearby, at one of the military bases. If you can blow up all of the military bases in the area, and blow up Dulles International Airport, as well, then you will make it difficult to travel for them, unless you blow up the all the air ports, all around Washington, Baltimore, Northern Virginia, Maryland, Pennsylvania, West Virginia, North Carolina, Tennessee, and so on.

If you destroy all the air ports the Washington D.C. congressional members use, then you will make life difficult for them.

Please, by all means, use the bomb formulas, that I have provided, and blow up all the airports, and all the military bases that you can blow up, and destroy the entrance guard shacks, and the run ways, and the barracks at the military bases, and the munitions depots, and the armories, where they keep many of their weapons stored.

You should also blow up the underground bunkers, where they have all the sensitive equipment, that they use, to listen to the chatting of Russian soldiers, and Russian housewifes.

While you are killing as many as you can, others can be making friends with the Lesbianists who accept invitations to visit the families of interested persons, who wish to learn sexaling techniques, in the classrooms, provided by the families, in their underground air raid shelters, and in their underground fun time dungeon play rooms. As time passes, when you've killed enough of them, and when the ones you've invited into your homes, have taught you every thing they know about sexaling, and lots about what they know about molding sciences, and other things of interest, for rejuvenating your bodies, for enhancing your libido, and for feeding the organs animals, cell animals, amoebes kiddies, and other animals in your bodies, you can ask them to come another time, and then you can make sure they find their way, to a new home, or apartment, as their old home or apartment may no longer belong to them, or be there, as former neighbors may have gotten rid of their old homes, since they were not available by phone, and no one knew where they were staying, for so long.

It may take us several years, to make an effective change, to a dozen years, or as long as twenty or even thirty years, to fifty years, or more, but eventually, we will make the changes we need to make, so that every one will get all information on the molding sciences, and so that every one will be able to learn the secrets of molding sciences, and the secrets of rejuvenating the human body.

New Releases Of The Programs And Operating Software

I am aware that, some people have a new copy of the operating systems, and of the software programs. I recently had my kids release, to the FBI and to the persons who are in charge of the audio and video surveilance links on me, as far as I could confirm, a new upgraded version of the operating system software and of the program software package. If the current government will cooperate, and distribute the software, then we can get the information on the molding sciences, and on the rejuvenative sciences, to all of you, soon. If they will not cooperate, then there is no alternative, but the ones that I've suggested.

Molds And Donor Bowl Technology

In donor bowl technology, you take a small container, about a gallon or so in size, and line the bottom of the container, with one or more layers of tin foil, and throw in a couple of rocks, that you know are clean, and that look pretty. If they look interesting, like a pyrite rock, with lots of different types of metals on it, and a little quartz you can use that, and you can throw in tourqouise, or malachite, or lapis lazuli, or a gold ring, necklace, bracelet, or ear ring, or a silver ring or bracelet, etc., and you can throw in a nice looking sterling silver spoon, that is not a cheap piece of garbage, that has metal pieces flaking off of it, like some table forks and table spoons, knives, and so forth, that come out of cheap, Taiwan or Mainland Chinese factories, or out of factories in Korea, or Japan, where the bottom line is all that matters, and find a good piece of your grandmothers' silver ware, or some thing comparable, and don't be stingy about silver ware, as silver ware is useless to your health, if you do not eat with it.

Silver plates, copper plates, bronze plates, gold plates, even gold plated metal plates, are all very good to use, and you'll find that what one person calls aluminum, or pewter, or brass, may in fact be a combination of ores, with many precious metals in it, despite the imprint on the underside or bottom of the piece, indicating it is sterling silver, or brass, or pewter, or whatever. We do not have the technologies to tell one metal apart from another metal.

Our technologies are too primitive, and so you can not tell when you have gold animals in your metal, in lots of cases, even if you have a piece of pewter. I have many types of gold animals kids, and they all get written off as slag, when the factories are melting down precious gem stones that they mine in vast quantities, and no one uses it, and it sits there, in the foundry yard, until the foundry yard goes out of business, and then vandals may steal a piece, but if the Lesbianists catch the vandals, they will kill them.

Workers try to take home a piece of pretty looking slag, or waste metal, that is scraped off the top of the bowl of liquidy, heated metal, because it is too light, as it is floating at the top. Well, many types of gold float near the top or at the top, and so does silver, and the steel is heavier, and so the top good stuff gets swiped off, or scraped off from the top of the molten metal pot, and it is dumped in the foundry yard, to sit there, and no one uses it.

Gold animals, and silver animals are as plentiful as platinum animals, and lead animals, and copper animals, and iron, and steel animals. There is no such thing as a 'precious metal" because they are all in my universe, eating, and munching on each other, and on other types of minerals animals, and on other tiny animals as well, and they make babies just like every one else does.

There is no lack for want in the baby making departments, and so there are just as many gold animals kiddies, as silver animals kiddies, platinum ore animal kiddies, as there are iron ore animal kiddies, and copper ore kiddies, and so on.

The reason the Lesbianists have their trick sales technique for "precious" metals, is because they know you do not know any different, and they know that you have not been educated, and they know that you are not smart enough to figure out what is what, as you do not have the technologies to investigate and determine who are my gold animals kiddies, and who are my silver animals kiddies, and who are my platinum animals kiddies, and who are my iron animals kiddies, and who are my copper animals kiddies.

How Plentiful Is Gold, Silver, Platinum, And Other So Called "Precious Metals"?

The Lesbianists hoarde the gold, and silver, platinum, and white gold, and they make it look scarce, and they ban people from mining national parks, and BLM recreational lands. The bureau of mines, has strict controls, and limits on land you can mine on, and the Lesbianists, for the most part, control all the useful land, and they do not let 'ordinary' people, get ahold of the useful land, and if an ordiary person finds a useful piece of land, the Lesbianists end up killing the person, and every one associated with the person, so that the issue is no longer a topic of concern for any one, who knew the person.

You are too stupid, so they think, to figure out any thing, since they have educated you in dummy sciences, that lead no where. Then they complain how stupid you are and about how little you know. So they spoof you, and they came up with the movie, the "Planet of the Apes", and its sequels, and they were written using you as the character of the 'ape', the common ordianary citizens of this planet, and the common ordinary citizens on all the planets they control, where as, they considered only them selves, the normal, "intelligent", human beings.

They laughed at you, in your monkey suits, as they employed the ordianary people of this planet as the actors and actoresses, to portray the 'apes'. Many of the actors and actoreses, where former Lesbianists, and they hate all of the former Lesbianists, as all former Lesbianists got kicked out of their organization, and they know who the former Lesbianists are, and they have beefs, or attitudinal problems and complaints, with all of you, who were Lesbianists, before you got trashed, grieviously tortured, eaten, killed, and with that, you were kicked out of their organization by them.

If you are a man with a vagina, and nine times out of ten, many of you still have a vagina, though some of you have worked off the karma, to have a vagina, such as you men and boys with normal genitalia, as you all had vaginas, all of you, because of the karma you had, killing females, led to that, and some of you worked off your karma, enough, and balanced out your karma enough, for you to lose that vagina you originally had, you were probably a Lesbianist.

Maybe almost every one of you, were at one time or another, a Lesbianist. There are not many people in my universe, except perhaps for me, who was not a Lesbianist, in the past.

If you are a woman with a dick, or with one that has been cut off when you were a young baby, because of the doctors advice to your parents, though some of you worked off that karma, as well, and balanced it out, etc., you were probably a Lesbianist, in the past, before they trashed you, killed you, grieviously tortured you, ate you, killed you, and with that, you they kicked you out of their organization.

It's the same case for females, as it is for males, almost every one of you, but there are a few exceptions, were a Lesbianist, in the past. The exceptions are the little, tiny people, who live in the abominated zones, in the pumpkin piggy patches, as I've mentioned about, before. There are other exceptions, but I will not go into them, now, because once you start studying in the 'Managing My Universe' program, you will learn all about who did what, and who ended up where, and so forth. In any case, that is some thing you can look into, later on.

Building An Underground Fortress, Or 'Playroom'

So the nice thing for you to do, would be to make friends with every one, and that goes for the Lesbianists, as well. You should all invite the Lesbianists into your underground rooms, and caves, and culled out work rooms. Culled out means, cut out of the face cliff, or cut out of the wall, or rock wall, or cliff, along side a river, or an ocean, or along a steep mountain face. Culled out work rooms, are not hard to make, but you need to know something about explosives, and blasting, and then, deconstructuring the surface of the cliff face, safely, so that you can little by little, safely, cut out, or cull out, a study, a garage, a work room, a tennis court, a bowling alley, and so forth that you can enjoy under your main piece of property, if you happen to live above a very high and large, solid, granite, or lime stone, etc, rock cliff, far above a lower valley, or river below, or very far above the level of an ocean, or sea, below, and off and aways a little bit, from where your property is located.

Once you begin making an underground, fortress, or play house, if you are a specialist, in explosives, and in architectural engineering, and geological engineering, or if you can get some friends together, who with your combined talents, can manage to cull out an underground fortress or play room, then you can build one, and you can later, after you have installed cold water piping, and drainage, safely, along with installing the electrical power generating facilities you'll need, to keep electrical company employees from snooping around, then you can invite your friends over, and have a block party, with trustable friends, and then you can invite some of the Lesbianists over, and make sure they understand that they are there as guests, on a temporary, but long term stay to teach you all about the molding sciences, and all about sexaling, and so forth, since they are all gifted instructors.

You could always get every one on your block, if they are all trusted friends, to set up a power grid, underground, using the electricity of every one, on the block, to power the underground play room, that you and all your friends will enjoy building. That way, if you build it right, and if you do not raise the suspicion of the power company's meter reader, or meter inspector, or any one else from the power company, who has upkeep maintenance work, to perform, from time to time, then you can safely put in a grid, and hook every one into it, so you can all share in the costs for the mutually enjoyed underground playhouse, along with all the sexaling entertainment, that you will all be able to enjoy, with your many friends, and with their many trusted friends.

Molds And Donor Bowls

With regards to molds and donor bowl technologies, after you've got your container set up, with a few layers of tin foil or so, on the bottom and sides of the container, and rocks and gem stones, etc., in the bottom, you can use that as a collection bowl, and go around and investigate the molded up breads that you have, and you should have between thirty of forty types of molded up breads, or more, to select from, and when you see some thing, interesting, after a few weeks, to a month, or more, you can pick out an interesting piece of bread, with lots of molds, or with just a few molds, and then you can combine six or eight of the different molded up breads, from six or eight containers, and then just place each slice of molded up bread in the 'donor bowl' container, and then, give it a few days to a week, to get leveled out.

Leveled out means, that the molds on each piece of donor breads, will each spread from one to another of the pieces of bread, and then you'll get a proliferation of molds, on all of your breads, and with lots of molds, it is generally safe to experiment, with a little piece of a corner of a piece of bread. If you cut off a tiny enough piece, you probably will not get too sick, if it is too potent for you to eat.

Try out the different molded up breads, and some may taste gentle, and tasty, and others may not taste to much to your liking, but after a while, you'll get to learn, what types of molds may cause problems with your body, and what types of molds will not cause problems with your bodies, and what types of molds to avoid eating, and what types to enjoy eating.

Molds will continue to grow, one over another, and one day, even though the molds may not be nice ones for you to eat, after a few weeks, and after a few tricks, such as placing those molded breads in with cherry juice, wine, or with sugary water, or with honey, or with fruit juices, fruits, milk, or sour cream, yogurt, or honey and cream, you can get the molds to grow, different molds, that will be more useful to you, and more tasty. There is a lot to study, about molds, and how to farm them, tender them as if they were your gardens, and cultivate them. The Lesbianists know all the secrets about all of this, so we need to convince them to give up the game, and start cooperating.

When you are examining, and sampling your molded up breads, jot down in a note book, accurately as possible, after you've described them to your self, the molds, and every thing about them, and give them names, and take photos of them, and keep a note book, for instance, with the pictures in them, and your notes, so that you can remind your self about what you saw growing, and what you learned about each one.

Technologies To Investigate Molds Gardens

If we had the technologies to investigate the molds, with a powerful enough microscope, that employed the proper technologies, and some computer software programs can be written by persons who know how to write them, and you can attach and adjust a lensing camera to your computer, you can take photos of the molds, and with the write computer program, once it is written correctly, it will be able to do many things, that you did not expect it could to.

They become very complicated to learn about all the technologies involved, but you can get some hints, from Sony, or Pioneer, or Mitsubishi, who have all invested much money into telephoto lenses, and video cameras, and they know all about the technologies that are needed, at least they have them, as classified material, in their documents storage rooms, and you can get copies, if you know the right people, and then you can write your software program, after studying all about the technologies involved, and after you've figured out what technologies are needed, and how to duplicate them, with your computer programing skills and your adeptability.

Adeptibility is a person's being able to know, intuitively, almost, after a lot of study, what it is you need to do, to get the results you want.

Once you put together the software program, you can have your friends use it, and give you input as to how to improve it.

A lot has to do with different types of energies, and how to send them out of the computer, and how to recieve them, back into your computer, and then how to decode them, to get the dramatic effects of being able to see through walls, or hard surfaces, that you never knew you could see threw. A lot also has to do with your ability to make a lensing system, which allows for viewing far away objects, as well as magnifying them, quite a number of times, all while keeping the clarity of the object in focus. You need to be able to light up the object, no matter how far away it is, and no matter how tiny it is, and you need to be able to get the light and imaging back into your camera, or into another camera, or into another pickup input device, a chip on a circuit board, such as an infared circuit board, and then how to drive that energy up, so that it is useful to you, and so that it will brighten up the image, that you recieve, back to your computer, once it has been picked up by your computer's infared reciever device.

It is a little tricky, to get every thing right, but with the technical input the Sony scientists, JVC Japan scientists, Mitsubishi scientists, Cannon, Nikon, and Fujitsu scientists, and paper copier company scientists of Dae Woo, and others, it will not be long before you can put together a computer program, that will sufficiently do what you would like it to do, and that is, investigate the tiny worlds where little worker animals of mine, go about their daily work.

You can even develop similar technologies to see other people, on other planets,if you are adept enough. You can even develop the technologies to be able to see other people on planets that are on the other side of a lot of obstacles, between you and them.

They have many technologies out there, that allow them to see you, and wave at you, but you don't have the technologies to see them, and call them on a video link up, and say hi to them.

You'll need some kind of tracking system technology. To track some one, you need to find a type or types of light energies, and possibly other types of energies, that allow you to bend them.

You also need to be able to pin point those energies, and keep them pin pointed, and on target. You then need to know the technologies involved so that you can lock those energies onto your target. If you can find the types of energies needed, you can get them to lock onto your target, and then they will bend, as you stay on target, and you can get a two way refractor system set up, and the light will come bouncing back to your infrared like energy tracking diode, or whatever it is you use, and you'll be able to lock onto people, far away, as their planet spins, and moves, and as our planet spins and moves, and you will be able to stay on target, and then you will be able to see them, and track them.

You need these pin pointing, and tracking technologies to track the little worker animals, who work for me, as well. You may need a number of other technologies, as well, to make it work, properly, but with help from JVC, Panasonic, Pioneer, and other technical scientists, you should be able to get it to work, without too much difficulty, if you are good at using your brain for these types of fun projects.

You also need to develop the listening capablities, and audio transmission capabilities, but that is not hard, because if you can develop the video transmission technologies, you can easily use your brains, and then, with thoughtful investigation, and research, and with some consulting with the scientists at Bell & Howell, Honeywell, Phillips, and other companies, they all have the information you are looking for, and they can all provide it to you, if you know the right people to ask for assistance at getting to it.

Long Distance Video And Audio Technologies

Rand McNally has already developed the technologies, for this type of software, and so has Phillips Engineering, Hawthorne Publishing Company, and a few other companies, as well, and if you know the right persons, you can find copies of it, and you can get it to work on your home computer, if your computer will run this software. I don't know what format they have programed their software in, but Fortran, or Pascal, and a few others, I think they have used. If you know what to do with it, after that, or if you know some one who would know what to do to get it running, you can invite your friends, and all of you can get the software set up, and then you can distribute it, among trusted friends.

Eventually, after you have put all the right technologies together, of if you should be so lucky as to get a copy of one of the systems that the companies mentioned, and perhaps others, as well, have already developed, but are not distributing, because the Lesbianists who run the companies, will not allow it, you'll be able to have long distance phone calls with people, far away, on other planets, and you'll be able to see and maybe even speak with practically anything in my universe, if not every body, if you are interested in seeing and speaking to them. The majority of people, nearly, have these technologies, so you'll be able to meet and speak with at least, those people who have the technologies that can interface with the technologies, that you develop.

There are also data bases, here and there, and you can learn from the many friends you can make, in our universe, and from the Lesbianists, how to access them, with the right permissions, and codes, if you can get either the Lesbianists to cooperate with you, or if you can get the people you meet as you go sky surfing, to cooperate with you, and ask them to use a translator program, to help translate their language into your language, so you can hear them in your language.

They have the technologies to be able to decode the languages we speak on this planet, but setting up the software programs to decode their speech, is a little too difficult, as it takes many years to put together, that kind of a system.

Managing My Universes Software, Etc.

If if you get a copy of the 'Managing My Universe' program software, that has the 'Sexaling For A Living' program explained, and many other programs, also explained, in depth, along with lots of useful information, you'll be able to get lots of help, and there are even programs that do these things for you, and you won't even have to worry about making the programs, because all the programs you need to be able to do all the above noted things, and much more, are all included in the software programs selections, for your use, once you join the 'Managing My Universe' program, and once you join the 'Sexaling For A Living' program, and once you swear in, and promise that you will sexal for a living, in accordance with the guidelines for the 'Sexaling For A Living' programs.

It's the new way my kids and I hope you will enjoy earning a living, in the future, as soon as we can get started, with the cooperation of those who have the software programs that I recently had my kids send off to them, using the video and audio surveilance systems, and the work force, they have in place.

The FBI, the White House, Jeb Bush, George Bush, Jr., Barbara Bush, Jr., George Bush, Sr., Barabara Bush, Sr., former general Swartzkoff, former general Colin Powel, Secretary Mike Johanns, Secretary Dirk Kempthorne, Secretary Carlos Gutierrez, Attorney General Alberto Gonzales, Secretary Robert M. Gates, Secretary Elaine Chao, Secretary Margaret Spellings, Secretary Condoleezza Rice, Secretary Samuel W. Bodman, Secretary Mary E. Peters, Secretary Michael O. Leavitt, Secretary Henry M. Paulson, Jr., Secretary Michael Chertoff, Secretary Jim Nicholson, Secretary Alphonso Jackson, Richard B. Cheney, Joshua B. Bolten, Rob Portman, Ambassador Susan Schwab, Stephen Johnson, John Walters, and others who are Lesbianists working for the President of the United States, will all know where you can get the software, and so please give them a call, and see what they have to say. Your state senators will also all have the software, or at least, they will know where you can get a copy of it. So please try speaking to them, before you busy your self, speaking with the other people, who are just Lesbianists stooges, who are just sitting in their chairs, like on holiday, just thinking who they are going to fuck over next, when, where, and how, before they eat them, while they are alive, and then kill them.

I wouldn't waste my time, too much with them, as they are not very cooperative, because they are all hard core Lesbianists, and they will not budge or flinch an inch, or admit to anything. They will lie, lie, lie, and lie, and that is all they will ever do, or so it seems.

The people on CNN, and on all the major networks, are also all hard core Lesbianists, with few exceptions. These Lesbianists will also just lie, lie, and lie, and they will never get any where near the truth, about nearly anything. They will give you the weather, but that is about all they ever tell you, that is truthful, one hundred percent, or nearly one hundred percent, since they even lie about things to do with the weather, as I noted before, since they call the industrial pollution in the sky, apple meyer, and that is a chemical haze yopu can see hanging over L.A., and Las Vegas, and New York, they helped to cover the planet with, with their petroleum industries technologies, so as to poison your health. They know all the sciences needed to keep them from dying, but they will not teach you the correct sciences, to help keep you from dying, as they enjoy watching all the people they hate, and who they enjoy killing, now and then, suffer. And they joke about you, and they call you, 'rodent rat people'.

They made a movie, the "Planet of the Apes", inspired by you, as they see it, and they continue to mock you, and toy with you, as some kind of chess game piece, and they will continue their silly games, until you are dead and gone, and then they will wait for your return, from my Epcot Center, which I have explained, about, before.

Fibromyalgia, What Is It?

What is fibromyalgia? Well, as far as I can tell, it is the plastics kiddies, from petroleum products, such as your camping mat, or your vinyl upholestry in your automobile, or in the taxi cab, or in your home, the furniture you bought that is covered in clear vinyl, or fake naugahide, which is a type of fake leather made from plastics.

Naugahide is every where, in vehicles, in trucks, in nearly every automobile, as the seat covers are made from it. It is a type of plastic, that is very comfortable, but it is made from plastics, derived from the petro chemical industry, and from the chemicals industry.

When you sit for long hours on naugahide, little fumes animals, and you can smell them, if you put your nose up to the naugahide, and you can smell, some times, a kind of material, that is similar in smell, some times, to leather, but it is not leather, though the companies that make naugahide, are very clever, and they know many ways to disguise the smell of the plastics kiddies by using different chemical compounds when formulating the naugahide compound material mixture, and the tanning formulas.

It doesn't hurt you right away, but over long months, and some times years, of breathing in the fumes kiddies from it, you will eventually begin to discover that you do not feel well, all the time. You might feel nervous, or edgy, or just uncomfortable. There are lots of people who feel this way, and they do not know why they feel that way, but they just feel that way, and they think, maybe I need some vitamin tablet, or maybe I need to go swimming, or sit in the hot tub, or in a jaccuzii.

Fibromyalgia can be experienced in a myriad of ways. Why is that? It is because there are so many different types of fumes animals, from the petroleum industry, we don't know which ones they are, that are poisoning our bodies, and they all hurt different amoebes animals, cell animals, organs animals, all over, inside of our bodies.

They eat up lots of different muscles in the body. They might eat the feet muscles on the soles of the feet. Or they might enjoy eating your leg muscles tissues. Others enjoy your back muscles tissues. Still others, they don't care too much where they get some thing to eat, and they go any where, in the body, and they eat all over the place, and you get sharp stinging pains, that are very uncomfortable.

We can not see these fumes animals when they are at lunch, eating our bodies up, and the muscles cells kiddies, and the organs kiddies, all over your body. I wonder how many types of fumes kiddies there are from plastics, and also, how many fumes animals kiddies there are, in petrol, diesel, kerosene, gasoline, Coleman's campfire lamp fuel kerosene, motor oil, and in all the petro chemical products, that line the shelves of the groceries stores, in every area of this country, much of Canada, and Mexico, I suppose, as well. I don't know what people in Europe purchase, or in Russia, or in the Soviet Union, or in Bulgaria, or in Serbia, or Croatia, Greece, Latin America, except for maybe some parts of Mexico, I can suppose they use similar products to what we use, in this part of the country, as some Mexican soaps, and detergents, chlorine bleach, kitchen soap liquids, and other products from Mexico, can be found in some of the local stores, here, such as Kroeger's or Food4Less, Albertson's, Smith's, Walmart, K-Mart, Target, and maybe some others.

I'm sure if we go to an automobile parts store, we can find lots of petro chemicals that we use to wash our cars, or motor bikes, off-road four wheeler bikes such as made by Suzuki, or Yamaha, or Honda, our camper trailer, motor home, or our motor boat.

We are surrounded in petro chemicals, and the air conditioners are puffing them out, despite the arguments of the technicians, who will say, they are safe. They leak out so many fumes, and no one can see how small they are, and many times, you can not even smell them. They build up, and then they begin to smell, when other petro chemical fumes, from the tar in the pavement in the roads, begins to mix with them.

Well, walking around in Las Vegas, we can get the same experience, any time, if we are healthy enough to have a sense for what smells good to our noses. If we are not always breathing in the fumes kiddies, and for instance, if we sit in a park, way out in the country, for instance, with an old log home, and lots of clear skies, and lots of clear running creeks, and streams, and ponds, when we spend some time there, getting our bodies detoxified, by good living, and good healthy eating, and with lots of molds foods, and with lots of ferment brews, and with lots of the healthy things we can make, such as I've mentioned, when we come back into the city, you will think we are entering petro chemical hell on earth.

It is so bad, the smells we have to put up with, and most people become immune to them, after some time, driving around, in traffic, and just thinking, this is normal, haveing the fumes of the buses, blowing into our cars, as they start out at the traffic lights, or the fumes of other cars, blowing in through our car windows, when they pass by, just as they are starting up, or while we are in congested traffic. Los Angeles is a smelly town, no doubt, but Las Vegas is one, too, and so is New York. Washington, D.C., is a smelly town, also.

Any way, even our homes, begin to smell, and we are immune to it, as we can not notice the smells, unless we go and detoxify our bodies, for several weeks, to several months, and then come back, and then try our noses smelling the carpets, the curtains, the bed linen, if made of rayon, nylon, or an other fabric that is not a natural fabric, such as cotton, or wool.

When we go out and purchase home cleaners, such as chlorox bleach, or shampoo, or soap, dishes and glases hand soap, dish washing machine soap, or Ajax, or Spic and Span, or Mr. Clean, Tide, or other product for cleaning the house, bath room, bath tub, shower, clothes, dishes, or whatever, we are bringing into our homes, harmful fumes kiddies in all those products. They escape from inside the containers, because we do not know how small they are. They are so small, they can escape with out our even knowing it. I am not kidding you.

When they escape, you're going to slowly get ill, and develop muscle and body aches. You can even experience degeneration of ligaments, sinews, tendons, and you can end up with tennis elbow, a bad back, and who knows what else, as these fumes animals eat up not only muscles in your bodies, but they also eat up the ligaments, sinews, tendons, and other fibers in your body, including your nerve fibers, amoebes in your brain, and cell animals in brain structures, and organ animals in brain structures and in nervous system wiring. They eat heart muscles, and just about every thing there is to eat, in the human body, including the teeth, and the sexaling organs, and every thing connected to your sexaling organs.

I mentioned that we have lots of organ animals in our bodies. Well, we have not only amoebes, and cell animals, every where in our bodies, but we have organs animals by the gazillions in our bodies. The fumes animals hardly discriminate, and they like not only muscles, and tendons, sinews, ligaments, cartiladge, nerve fibers, and other fibers in our bodies, but they like to eat the organs animals, the amoebes, and the cell animals, too.

It begins to hurt, with very stinging pains, as far as I can tell, when they start eating up the organs animals. The large the animals in the body that are being eaten up, the more severe the pains, unless you have a lot of animals, of all different sizes, all being eaten up, at the same time.

Well, to cure this, or rather, to stop this, we have to live in log homes, drink water that is not chlorinated, and I mentioned that chlorine is a petro chemical liquid, that is used in jet fuels, and even in some high powered cars, on some planets, instead of gasoline, because chlorine, when it is carefully mixed with other petroleum liquids, and other ingredients, can make a very powerful race car engine fuel.

Next, we have to eat lots of ocean salt and eat a well balanced diet. We need to increase our salt intake, till we use about up to two and a half, to three pounds of salt, to eight pounds of salt, depending on the size of the person, or possibly more pounds of salt, as in the case of the big sumo wrestlers in Japan, and in Samoa, and in Korea, and other places, up to about ten to twelve to even eighteen pounds, or even somewhat more, up to twenty or even thirty pounds, each year, for the large sumo wrestlers, who have lots of problems with fibromyalgia pains. One sumo wrestler, who weighs about eight hundred pounds, needs about forty or more pounds of salt, easily, each year, for helping him with his fibromyalgia pains, to kill the fumes animals in his body.

Some people may get by on less salt, if they do not have severe problems with fumes animals, i.e., fibromyalgia animals, but for most people, you need to increase your ocean salt intake, and not use iodized salt, as that will worsen your problem, as it is poisoned with petro chemicals, and no one tells you, and it is not on the label.

If we increase our ocean salt intake, we will get over fibromyalgia, in time. To repair our bodies, is more difficult, once you have increased and maintain a steady high level of ocean salt, in your body, daily. If we let it drop, we can get ill, once again, if we inhale fumes, animals, and they are in the carpets, and in the curtains, and in the ceiling tiles. Don't be fooled. The Lesbianists put fumes animals in every thing they possibly can, since they want to make you suffer.

They know they only need to eat lots of ocean salt, and they laugh at you, when you get sick, and when you suffer, and when you can no longer work, like many fire men, and fire women.

When we have a house burn down, there are so many fumes animals that are let loose into the air, we should just run for cover, and forget about putting the fire out, as we are certainly looking for health problems, though we do not know it. There are many fire men, and fire women, who are so ill, they can not get up in the morning, and no doctor knows what their problem is. Well, it is simple. They inhaled so many fumes animals, their bodies are being eaten up, from the inside out, and the Lesbianists just laugh at them.

Asking The Lesbianists For Specific Information On How To Repair The Damaged Animals In Our Bodies

To repair the damage to the organs animals, and to the amoebes, and to the cell animals, we can ask the Lesbianists for information on the types of molds they use, to help them help their organs animals, and other animals, repair themselves.

When there is a big forest fire, the government calls out soldiers, and others, such as national guardsmen, and national guards women, and soldiers from many marine bases, or army bases. Professional fire fighters are also called to the scene, and they pitch in, and try to put out forest fires.

It is really perverse, when you think about it. The natural woodlands must burn down, to then regrow. Nothing is hurt, as trees have roots that are so deep, and that go off in many miles in many different directions, so long as there is a stump to that tree, above ground, that is all that is needed, for that tree to regrow, within a few hundred to a few thousand years, depending on what type of tree it is, and where it is growing.

That is silly, isn't it. Well, what is worse is that the Lesbianists tell the fire fighter crews to put the fire out with petro chemical flame retardants, they either spray on, from a short distance away, or that plane and helicopters over head, drop onto the fires, and burning trees, and shrubs, below.

The fires eventually return, with in a few years, some times, and guess what. All those petro chemical flame retardants get burned up, and the fumes make the fire fighters so ill, many of them simply die. You do not hear the statistics on the number of deaths among fire fighters, but there are many, and they are often times, military soldiers, who die, and the family gets a note that their son or daughter died, and little else is said about it, except for the information on the funeral. This is ridiculous, and it needs to stop, right now.

However, there is a problem, here. We all have karma. This is some thing that we can not get around. Many people do not know what karma is, and many people do not believe in karma.

Well, that's up to them, but the truth is, there is some thing I call karma, and it is just a record of all your good behavior, and a record of all your bad behavior. I am a sneaky guy, and I have my kids record your karma. And you can argue about it, all day if you like, but that will not mean anything, because my kids are always recording your karma, whether you like it or not, and whether you believe it or not.

Now how are you going to deal with that karma? Well, you can keep going through one life time after another, being made fools of, by the Lesbianists, or you can start sexaling, and you can try to practice my religion, as I've explained about it, on my bulletin board. When you start practicing my newest religion, you can begin to get your karma straightened out, and soon, after many gabillions of years of practicing my religion, slowly, people will stop making fools of you.

That's how serious it is, your karma. Until you work on erasing it, and it takes a long time to erase, because we've all been here, in my universe, longer than any one can possibly imagine, and we have so much karma, it will take us nearly eternity to erase it all.

There is more to karma, than that, and you can study and learn about it, once you join the 'Managing My Universe' programs, and once you join the 'Sexaling For A Living' programs, which I've mentioned a few words, about.

Until you erase your karma for being made a fool of, by these Lesbianists, and for being made a fool of, by your friends, and family members, and school teachers, and by others, you won't really be able to be happy. There are lots of things we need to erase our karma for. Not only for being made fools of, but also for just being bad people.

What Is Our Job, From Now On, In My Universe?

We have been so bad to each other, over the many kazillions plus years, we have been living in my universe, life after life, and no one can count how long we've really been here, as it is just too long. All that time, even from the very begining, when we first got here, and began living in my universe, it wasn't long before we started acting, badly. That snow balled, and now we have so much karma, it is just ridiculous.

Anyway, that's our job from now on, and you and I are all going to get to work, erasing our karma, and learning about karma, and learning about how things work in my universe, and in time, we will begin to understand that, truly, indeed, our main job here, in this big bus station terminal center, as I've called it some thing like that, before, is to erase the karma that my kids, as well as us, produce.

It is our jobs to erase it, by practicing my religion, and by sexaling, religiously, in time. In the begining, you will not think that sexaling is a religous act, or a religious activity, but it is, and as the kabillions, and katrillions, and kazillions of years go by, eventually, you'll begin to learn, and so will I, that sexaling is a religious activity. When people say that, I'm sure they must have a smirk on their face, as no one thinks that sexaling is a religious activity. Well, we can smirk all we want to, but in time, we will learn that sexaling is indeed a religious activity. It will take a lot of time, and a lot of experience, but after who knows how many years, eventually, we will get brighter than we are, in the head, and we will begin to understand that sexaling is a religous activity, just like praying is. There are many religious activities, many people will think, 'Oh you've got to be kidding me!', but one after another of them, in time, you will learn that they are religous activities. I've mentioned about some of them, before, and people smirk, and laugh, and giggle, and no one takes me seriously, but that is to be expected.

In any case, in time, we will see that these activities are all religous activities. In the mean time, no one really cares, I don't think, as so many people will just enjoy sexaling, all the time, or some of the time, as some people are not physically able to enjoy sexaling, with others, as it is their karma to not be healthy enough to enjoy sexaling with others.

There are people with nervous system problems, and there are handicapped people, and elderly people, and people with all kinds of disabilities, who do not like or even think of sexaling.

In time, we will all get our karma straightened out, and we will work to erase it, as the years go by. In time, more and more, people will get healthy, once again, including me, and in time, people with fibromyalgia, and with other nervous disorders, autism, and all kinds of health problems, and physical handicap problems, they will all get better, and they will all learn about rejuvenating their bodies, and in time, we will all be living forever, in my universe, erasing our karma, and the karma of my working children, who do not have the time to work on it, themselves.

Erasing karma will be our main job, as there will always be lots of it to erase. There are my many worker animals in my universe, and who will erase their karma? We will. Every one who works for me, will give me some of their karma, and it will be up to us, the people living in this main central bus station terminal, to erase it.

Why are we stuck with the job of eraseing it? Because that is our only job. My kids have many jobs, and they keep my universe going. Now, with my religion, to help us, you will spend your energies, for eternity, working for me, and erasing the karma of my kids, and of my many worker animals. Other wise, our universe will not run well, and it will collapse, and come to a halt, and then we will not have any place to live.

You will all learn more about all of this, once you join the 'Managing My Universe' programs, and once you join the other programs we have, including the "Sexaling For A Living' programs.

...even though it works if you pick a lower wattage bulb to keep the
charging current down. Not a good idea really. :-)

I've used series lamps a few times when testing "unknown" valve gear as
it helps keep the "holy smoke" inside the transformer box. Cheaper and
less noisy than fuses.

I use a variac and monitor the current as I turn it up.

I used to have a pal called OXO, Jim G6EQK, who used to use something of a similar device to the 3 dollar battery charger on TV tubes when they went flat.

> http://medpics.findlaw.com/generateexhibit.php?ID=3D13860&ExhibitKeywor...
>
> These pictures, and all other pictures like it, are totally bogus. There are no guts, bending and twisting to one direction, and then to another direction, that eventually find an outlet at the poop hole in the human body.
>
> Chimps, apes, and monkeys may have these types of stomach 'tripe' that is longish, twisting to one side or to another, going back and forth,

> and then wrapping or folding down under other tummy tubes, and then twisting in and then moving outwardsly, as chimps, apes, and monkeyes live on banana foilage, twigs, seeds, hard shells, and other difficult to eat, hard, rubbery, plant roughage, of one kind, or of another. Some oselots may have this kind of tubeing, and so may many other animals, but not the human being.
>
> In the human being, there is in reality, no such guts or tripe tubeing, and there is what is called a 'shank'. A shank is the human being's tummy tube, or the desceding colon tube.
>
> Your tummy tube descends from the front right side of the tummy, in the near to upper to middle to near lower area or section of your tummy, depending on the person. Some people, may have their tummy tube, the ejector pipe, also called the descending pipe, a little higher up, than other people. Some people may have their ejector pipe a little lower than other people. That is not significant.
>
> The muscles inside of the tummy, and surrounding the tummy, cause a pushing motion, to eject the tummy food, that has made its way to the back side of the inside of the tummy, and to the lower or middle area, near the eject pipe, on the inside of the tummy. Once your tummy food makes it there, the muscles begin to squeeze on it, and the muscles on the inside and on the outside, squeeze on it, and force it up and out of the ejector pipe, and down a chute, or the descension colon pipe.
>
> The descension colon pipe goes in a nearly straight line, almost perfectly straight, in some people, directly to the out put terminal, which is the poop hole.
>
> The intake for food and beverages from your lips, mouth, to your throat, or food pipe to connect your mouth to the tummy, that connector location is on the top side of the tummy, on the left side of your tummy, as you face forward. There is a tiny amount of terminal area, that's your stomach area, that is the terminal area, on the top side of the tummy, that is to the immediate left of the intake tube terminal entry way, itself. That means, there is a descending tube from your mouth to your stomach, and it connectes to the left side of your stomach, not all the way to the left, but nearly all the way to the left side of the stomach, but on the top, generally, and in some people's cases, it is a little down, from the top, less than an inch or two from the top.
>
> So the intake tube from your mouth sort of goes in to your tummy, from the front of the tummy, a little lower than from the top side edge of your tummy. The top edge of your tummy is located just about at the same height as your titty nipples are located on the chest. The little inwardsly pointing, dimple, in the middle of your chest, a very large dimple, just above where the rib cage begins to open up and spread apart and where the tummy muscle cavity can be felt, that dimple, or inwardsly pointing cavature, or the caving inwardsly of the chest bones in that area, some times slightly below, sometimes slightly above that point, is where the tummy's top edge is found. The tummy's

> top edge runs horizontally, more or less, across from one side to the
> other. It does descend at the outer edges of the tummy, to form a
> pouch system.
>
> A bogus drawing of the Lesbianists' pretend 'esophagus' for all the
> med school students to ponder over, and of a pretend tummy, which has
> the connections on the back side, where they are not located, but on
> the front side, where they are located, can be found at,
>
> http://medpics.findlaw.com/generateexhibit.php?ID=3D4599&ExhibitKeyword...
>
> The tummy does not look like a cashew peanut, like in the drawing. It
> is a pouch, and it is more oval in shape, kind of like a box, but a

> extend or another. The discoloration is an indicator of the fact that
> these sense organs, or love making instruments, are major sexaling
> instruments. The other organs of the body, are minor sexaling
> instruments. All of them, are sexaling instruments when you activate
> them, by massaging them, and by rubbing them, and so forth, and they
> will begin to shoot off energies, and those energies will purify and
> holyfy your life and clear up your karma and the karma of the people

> around you as those energies will shoot out in all directions cleaning up my universe, as they go zinging outwards. The energies will erase your karma, over time, and if you pray with a prayerful minded statement in mind, while sexaling, your karma that is related to that prayer, that needs to be erased, will get erased, little by little. For examply, "I pray that I will be able to have the good health and prosperous life, that will allow me to live, comfortably, and without distress."
>
> ## Sexaling And Prayer Statements
>
> The negative karma that you have, that would prevent you from living a healthy life, that is also prosperous, and without distress, will slowly, over time, get erased, as you make your statement, every time you begin sexaling, or every time you begin a sexaling session. If your sexaling sessions are going to go for days, say, three to eight days, for instance, you might want to repeat the prayerful minded statement, every eight to twelve hours, to fifteen, to thirty, to fifty hours, or so, to 'freshen' it up, once every so often. The more you freshen it up, the better it will work. The prayer will apply to not only you, but to every one else who is sexaling, if you say, "I pray that I and every one else will be able to have the good health and prosperous life, that will allow not only myself, but all other people, as well, to live without distress." This statement is a bodhisatva minded statement, and it will produce better results. Prayer statements said with others in mind, in addition to your self, produce better results, as a general rule. Why is that? Because we want to purify not only your karma, but every one's karma, and you get extra points for thinking about every one else and their needs, as well as your needs. Not only your self, but every person who is sexaling, during the time you are sexaling, and during the time, you continue or plan to continue sexaling, as one long sexaling session, will benefit from this prayer statement.
>
> ## The Butt Hole Sexaling Organ And The Shank Sexaling Organ
>
> The butt hole is also discolored, in all human beings, and that is an indicator that the butt hole is a sexaling organ.
>
> The discoloration of the butt hole entrance, is an indication of the fact that the butt hole entrance is a sexaling organ. If we look inside the butt hole, we will notice that the entire length of the 'shank' is discolored, and therefore, the entire shank is a sexaling organ. Sexaling organs are different in coloration, than the normal skin coloration of the body.
>
> The discoloration is due to the fact that there are a gazillion plus tiny blood carrier veins and arteries, that are very tiny, so tiny, you can not see them with today's 'current' medical microscope technology that is in the hospitals and labs, used by doctors, scientists, and lab technicians. These tiny blood 'capillaries' or fluid flow ductways, are too small to be seen by a doctor's microscope, or by a lab technician's microscope. These fluid flow

> ductways, or capillaries, are all clustered together, in high densities. When they cluster together, that is for a purpose.
>
> They are clustered together in high densities to allow for fluids to flow to the nerves in that area of the body to feed all the mouths in the nerves of that area of the body. There are clusters of sense nerves that are extremely dense, in all the sexaling organs. Where there are high densities of sexaling nerve clusters, there are lots of fluid flow ductways, or capillaries, and the area of the skin that is visible to your eyes, will show a slight to moderate, to heavy discoloration, due to all the fluids flowing through the area, carrying food and nourishment.
>
> ## Nerves
>
> Nerves are organs in them selves. The smallest nerve organ is a nerve cell, perhaps. My memories are not very good, so we might find smaller nerve organs, as my memories improve. A nerve cell has all the organs in it, to allow it to function as a normal, living being. That means, it is alive, and it thinks, and it cogitates, or mulls over thoughts, and it considers, for instance, 'What am I going to do, now', and it has lots of thoughts, and it stays busy doing lots of thinking, and by doing lots of cogitating, and by doing lots of communicating with other nerve cell organ kids of mine.
>
> ## Nerve Units As Living Beings, I.E., Creatures
>
> Nerves, just as nerve cells, form units, and as a unit, they form a living being, or creature, and all of them have mouths, since all my creatures have mouths, and they all need to be fed.
>
> The sense nerves, the erotic nerves that are clustered together, need to be fed the foods and nourishment that they need to be healthy and fit, so as to be able to respond, to stimulus. They need to eat to be healthy, so that they will then be able to respond when stimulus is applied to that area of the body, where they are located.
>
> Each organ in the body, has a brain, and a mouth, and a stomach, and a poop hole, and a pee hole, and all the other organs they need to survive with.
>
> Some organs, maybe all of them, need to feel comforted by other organs, i.e., creatures of the same kind as they are. Some organs like to not only speak to other organs creatures who are like them, but they also like to snuggle up to one and another, and they get cozy with one and another, all snuggled up, suddenly, before any one new it, pwoop, and they make a baby organ or creature who looks like mommy and daddy.
>
> Organ creatures of course can sexal, because if they could not, they could not make baby organ creatures. Organs can sexal just like human beings can sexal, but they sexal in their own particular ways. They like to sexal, just like human beings like to sexal, and they also go

> ouch, when some one or some thing pokes them, or pricks them, such as the doctors needle at the doctor's office.
>
> Each nerve cell is built with all the organs it needs to survive, and each organ is built with all the organs it needs to survive. The number of organs in the human body is almost limitless, but not quite limitless, as you can still count them, all, if you have the time.
>
> ## Brains And Notational Thoughts
>
> Each organ is a living being, or creature, with a brain, and with notational thoughts. Notational thoughts are memo types of thoughts, such as about, 'oh, boy, that sure felt good', or 'golly, gee, I am really bored'.
>
> One notational thought, for instance, that is of use to you, is when you are in need of water, and you begin drinking water, when you get the feeling that you need lots of water, and you get a message to your brain that you are in need for water, because you know you are low on water, and almost out of it, well, the inspirational thought that tells you, "keep drinking, keep drinking, you are too low on water" that is an inspirational thought, that your tummy and its brain is passing on to an area of your conscious mind, where you can then pick it up, and then act on it.
>
> There are many kinds of notational thoughts organs can have and organs can pass on to our 'brains'. Organs, as living beings, also do lots of chit chat with other organs, not only with the organs inside of your own body, but also with the organs inside of the body in other animals. Brains are brains, and they are very smart, if they are to do the duty they are assigned to do, which requires them to be smart. They are so smart, they spend a lot of their time, communicating and chatting with other organs, to see if every one is alright, and to find out what the latest gossip is. They can do many things, and that is the topic for another time. But one thing they can do is talk to each other. They have their own languages, they speak to each other with. Did you know that? I bet you didn't. If you are a Lesbianist, you may probably know this, as you probably studied about it, in your school days. Some kids, five or six years old, study these things, on planets, where education is up to the standard, that I set it at.
>
> If we understand that brains are in every organ in the body, and some organs, have multiple brains, almost all of them do, and if we understand that they are able to communicate to each other, than we can understand that the vagina is a living being, and it has a brain, and it talks with other vaginas, in other women and in other girls. The dick has a brain, too, and it talks with other dicks, and it talks with vaginas, as well, when a vagina calls to a dick, and asks it questions.
>
> ## Feeding The Organ Kiddies The Foods They Need
>
> We need to feed the body, many foods, not only tomatoes, potatoes,

> asparagus, meat, and fruit, etc., but we need to feed foods to our
> body for feeding the organ kiddies, the organ animals, the living
> beings, or creatures with brains, called organ kiddies who are inside
> of our body.
>
> What are we doing when we feed the body? We are supposed to be feeding
> not only our face, loading food in that tastes good to us, and to our
> sensibilities, but we are also supposed to be feeding the animals that
> live in side of us, as well as, we are supposed to be feeding the
> organ kiddies, who also need food to stay alive. We also need to be
> feeding all of the other animals kiddies, the living creatures of
> various kinds, that are living inside of our bodies. Most organ
> kiddies are on a starvation diet, nearly, and they survive on nearly
> only water. Some are lucky and get some pee and poopy juices from
> animals that live inside of our bodies.
>
> Most of the organ kiddies are not lucky, and they languish, from day
> to day, with nothing to eat, and they hang on, and they do their best
> to perform for us, but in the end, they are defeated by our not
> feeding them, and they give out, and give up, and throw in the towel,
> and say, "To hell with it. I don't care anymore." and with that, they
> cancel their agreement to work with us, and they say good bye, and
> they then slowly perish, and as they do, so do we. We perish because
> we do not feed the organ kiddies in our bodies, and because we do not
> feed the cell kiddies in our bodies, and because we do not feed the
> amoebe kiddies in our bodies. If we feed them all, we would not die,
> and they would continue to live, properously, and progenerate, or give
> us babies, to take over the jobs of mom and pop, Sr., the first organ
> kiddies in our bodies, who want to work with us, and who want to be
> fed, while they work for us, when mom and pop, Sr. are near the end of
> their run, that is their work life, and when it is time to call them
> in to my Epcot Centers for them, for them to get their check up, and
> repairs that they need, to their brains, and to their nervous systems,
> and to relieve them of any undue or unwholesome stresses, nervous
> tension, migraines, and so forth.
>
> You might be thinking, "This is a joke", but it is not a joke. You are
> completely wrong if you think this is a joke. If you feed the foods
> that organ kiddies like to eat, to them, they will become alive with
> activity, and they will work hard for us, and we will feel a new sense
> of vitality, and we will regain our good humor, to some extent, as it
> is a karmic issue here, as well, having a good humor, or a pleasant
> personality, and when it is time for mom and pop, Sr., organ kiddies
> to pass on the work load to baby Mac, and baby Sarah, organ kiddies,
> Jr., they will pass on the work load to them, and Poppa and Momma will
> retire and make their way, with assistance from their kids, and with
> assistance from my kids, to my Epcot Centers for them.
>
> This is a complex topic to discuss, and I won't try to discuss it in
> full, obviously, as I am too stupid, and my brain is not working, and
> I can't remember every thing about it, obviously. But, you should
> know, that if you feed them the molds animals, the molds fruits and
> gardens produce, and the funguses they like to eat, and that they

> enjoy eating, and the other foods that they eat, from fermented mash, made correctly, and from molded foods, and from molded breads, molded chesses, properly cooked meats, and so forth, they will feed on the animals in that food that you prepare for them, and you'll get healthy, and they'll get healthy, and they'll live for three hundred to eight hundred to fifteen hundred years, or more, depending on which ones you are talking about, and they will work for you, with zest and vigor, before it is time to hand over the work load to baby Mac, and baby Sarah, organ kiddies, Jr.
>
> If We Were Able To Be Born With "Owner's Manuals" For Our Body And Brains
>
> We are not born with an owner's manual for our body and brains, etc. If we were born with one, we would be told that if we feed our body properly, the body will last us forever, and we will be able to live forever. This is the norm for the human body. It is not a 'dream' or 'hope', or 'wish'. It is merely the truth, and once you learn how to feed your body, and all of the animals and creatures inside of your body, you will begin to make all the animals and creatures inside your body, happy, and they will begin to work for you, as they were intended to work for you. They are all my worker animals, and they are here to work for me. I have many worker animals, and we will learn about all of them, and we will find those who we need to help us feed our bodies properly, so that we can all live in the body that we were born in, that is meant to last you forever, if your feed it and nourish all of the animals in it, properly.
>
> If you do not feed my worker animals in your bodies, the nutrients, the animals and the plants animals and the foods that my worker organ animals in your bodies like to eat, that will allow my organ worker animals, and all of my other worker animals, to live with vigor and tenacity, strength and good health, they will not work very well for you, and in time, they will all perish, and so will you. I mentioned my worker animals in the molded foods, molded fruits, molded citrus fruits, fermented beverages, and so forth, that we will be making. They are all there in those foods that we will make, and then use to feed ourselves with, to then help feed all my worker organ animals, my worker cell animals, and other worker animals, that are in your body, and that need to be living in your body, working hard for you.
>
> If you do not feed them the foods that they like to eat, they will not live for long, and they will perish, and die, and that will be that, and you will not have a chance for living more than a hundred or two or three hundred years, in that body of yours, if your karma is good, and if you were not being poisoned by the petro chemical industry, and the chemicals industries, and by the foods manufacturing industries, and by the pharmaceutical manufacturing industries. We will never hear the Lesbianists admit that they are intentionally poisoning us, but they are.
>
> Once you find a way to survive on molded up, wholesome natural healthy foods, with no pesticides, and on water that is not chlorinated, and

> that is wholesome to drink, and after you learn the abc's of proper eating, to feed every one in your body, as well as you, then you will not die and you will begin to live forever.
>
> The Lesbianists are afraid that you will learn to eat properly and then, when you begin to get your diet together, not only for your self but also for all the animals and organ kiddies in you, and for all the cell animals in you, or cell creatures, who are smart living beings, by the way, you will begin to be able to extend your longevity, and then, in time, you will be able to live forever.
>
> If you stop drinking the poisonous coffee in the office, as I've explained about, previously, the Lesbianists make it with diesel fuels, and with gasoline, and with kerosene, if you stop smoking the poisoned cigarettes, if you stop using the plastics furniture, and other plastics products, if you stop inhaling the gasoline fumes kiddies that cause fibromyalgia, and fumes animals cause the sharp pains in the body as the fumes animals eat up and destroy the organ animals in the body discharging energies or electrical currents, as they mate, and as they sperminate, and vagicate, or eject female animal sexaling juices, like some jelly fish do, and like some deep sea snakes, and worms, that are lit up, with pulsing lights in them, when they mate, do. Fumes animals also cause arthritis, ligaments problems and diseases, and other health problems. If you stop inhaling the plastics fumes kiddies, which also give you fibromyalgia, arthritis, etc., and kill brain cells, and cause brain rot, Alzheimer's disease, and parkinson's disease, and a number of other illnesses, and if you begin to eat properly, in accordance with the proper rules for diet, that our body and brain owner's manuals would explain about, if we were to be born with these manuals at the time of our birth, then, you will begin to get healthy, and you will begin to live forever.
>
> So, good luck, and do not vote for Hillary Clinton, or any of the other presidential candidates, and if you see them, give them a beaver cheer, some people call it a 'Bronx cheer', and the noise you make sounds like someone farting in their direction. That may sound childish to say, but it is what the Lesbianists deserve as you are being played for a fool, every day of your life, and you should snap out of it, and do some thing about it, as soon as you and your friends can get it together to begin sexaling, in the ways I've explained about.
>
> Duplicator Tests
>
> In a duplicator test, there is one strand of a piece of the body, and you take that strand, and with medical and scientific technologies, you attempt to make a copy of it.
>
> Why do they make a copy of a strand of a piece of a human or ape, monkey, dog, or cat, etc., body?
>
> To test for various possibilities as to who the strand came from and

> how the strand came from the source, and what has happened to the person, if it was a person, if the person is no longer here to stand in for himself or for herself, in the case of a missing person, for instance.
>
> What is meant by a strand of a piece of a human, etc., body. Usually, a piece of flesh is a good place to start. A clipping from a person's finger nails, can be duplicated, if the sample is tiny enough, and it can be analysed, and then compared with an original shard or piece from a person's finger nail, a known subject's finger nail, and then a match up can either be made, or not be made.
>
> Human blood cells can be duplicated and matched. Human skin tissues can be duplicated and matched. Human organ tissues can be duplicated and matched.
>
> These matching tests are in fact, one example of a organ animal giveing birth to a baby organ animal, or to a number of baby organ animals.
>
> I'm not sure what they call the test, in the laboratory, but that is a duplicator test, in my vocabulary, and it should be a simple test that all county, municipal, and other police medical technical labs, forensics labs are capable of performing.
>
> This example of a matching print from the one strand of a piece of the body, is an example of organs animals, giveing birth to baby organ animals.
>
> Red blood corpuscles, are often tested, in this manner, I believe. A corpuscle is an organ animal, and it will give the same results, and you can make baby blood corpuscle organ animals.
>
> A high school, or jr. high school science lab technician or teacher, or in some school labs, including jr. college science labs, and technical labs at medical technical schools, teaching assistants, should be able to perform this test as it is a simple test to learn how to perform, and even off duty police officers, are taught it, in their free time, for fun, or for advancing their career. Licensed Practicing Nurses (LPN's) generally know about this test, and so do all doctors as well as your general medical school student, and two year college, or four year college, nurses course students. Botanists know or should know this test, and there are many professions where in this test is common, such as in paleontology, the study of human remains, bones, and so forth. I don't know what people on this planet, understand a paleontologist (Note: 'paleo-entologist' I think may be the correct spelling, but I'm not sure) as, but in my vocabulary, as it is comming back to me, a paleontologist explores and investigates old bones, fossilized bones, old grave sights, and so forth.
>
> Elementary school students, and maybe some kindergarden school students, in advanced kindergarden schools, such as in Japan, and in Europe, and in different countries around the world, can do this test,

> if their science lab teacher lends them the technical books, and tools to take home, study, and then show the family and parents, how a duplicator test is done. It's not a difficult test to perform, if you can read, and if you know what a beaker is, and so forth.
>
> This will give you a start for the search for proof as to whether or not there are organ animals in the human body, and in all animal body's and in all living being's bodies. It will provide proof that organ animals, once you've identified them, can in fact give birth to baby organ animals.
>
> There are a number of types of duplicator tests, lab technicians perform, in their day to day job routines, in medical labs, and the duplicator tests are generally for making comparisons, of one type or another, or for one reason, or another. They all give the same results, they provide you with proof that organ animals do exist in the body, and that organ animals do make babies.
>
> ## Sexaling With Family And Friends
>
> Sexaling with your family, relatives, trustable neighbors, and so on, will help you to begin to erase your karma, if you begin your wholesome, purifying, and holyfying sexaling with your family, relatives, kin, trustable neighbors, and others who are trustable. As you erase your karma, little by little, you will begin to get better karma, and you'll begin to be able to get rid of these Lesbianists who make fools of all of you, and who toy with you, one life after another, as you go into my Epcot Center, and then come out again, as a tummy baby to a tummy mommy and to a tummy daddy, on a fairly predictable basis, meeting up with your former friends and colleagues, over time, and then going through the six, or ten, or twelve, or forteen, or sixteen, etc., years of schooling, each time you come out, to lead a very short life span, with, once again, all of your organ kiddies and other animals and living creatures in you, nearly starving to death, the whole time you are out here, with your friends, playing, golf, swimming, playing tennis, football, entertaining the Lesbianists, and so on, until it is funeral time, and then back, once more and into my Epcot Center, until a new tummy mommy and a new tummy daddy, are waiting and ready for you to come out again.
>
> This is not a joke, I need to repeat, and you should start thinking about doing something to bring a stop to this abuse of your organ animals and other living creatures in you, and to bring a stop to the abuse of you, by the Lesbianists who will not tell you how to do any thing that is good for you and that is good for your health.
>
> ## Massaging The Butt Hole And Shank
>
> If you work massaging the butt hole for a few hours, fluids will begin to form, and the tissues of the shank, and of the butthole, will become more pliant. They will become stretchable, and they will, after a number of hours of massaging the butt hole, and the inside of the butt hole, little by little, as you insert a dick up the hole, as it

> gives way, and becomes more pliant, after a few hours, or so, it will
> soon be able to become opened up completely, and a dick can then be
> inserted and the shank then becomes a sexaling tube.
>
> On the end of the dick, there is a 'pooper scooper', or head level
> scoop pipe. The head level scoop pipe is the peculiar shape of the
> dick at the tip of it. This shape allows you to insert the head of the
> penis into the butt hole, and then take a wee wee, and then mush up
> all the food that is stuck in the cavity, and after a little mushing
> up of the food in the tummy pipe, or shank, you can then begin to
> scoop it out, little by little, with one dick shovel head, after
> another.
>
> After seven or eight dicks, to twelve to thirteen, or so, on the job,
> pumping, and peeing, and scooping out the poop, and ejaculating, as
> well, you can eventually scoop out most of the poop from the shank.
> Some may remain near the top, so a few more pee pee's into the butt
> hole, will help wash out the tummy tube, and it will become clear and
> free of digested food matter.
>
> The large and small, i.e., the meaning or intent of this paper, or
> note, is to let you know that the poop hole is a sexaling organ, and
> that the poop tube is a straight tube, and not a twisted up, bundled
> up, chimpanzee, or oselot guts piping, or bear guts piping, or horse
> guts piping, or pigs' guts piping, or cows' guts piping, as the
> medical community, would like to have you believe, along with the
> hoards of bible thumpers, who colluded with the Lesbianists of the
> medical community, to keep you in the dark ages.
>
> You are being played for a fool, every day of your life. If you can
> allow the Lesbianists to make a fool of you, every day of your life,
> and if that is alright with you, than go right ahead, and play their
> game, and let things stay as they are, but if you are not willing to
> allow them to make a fool of you, then you had better get busy,
> sexaling, and so forth, as I've already told you what we need to do,
> to help bring about the changes we need to make.
>
> Sending Hillary And Obama On Their Final Rides
>
> A vote for Hillary Clinton for president is a vote for stupidity, on
> your part. A vote for Obama for president, is a vote for stupidity, on
> your part. Now why doesn't somebody kill Hillary Clinton, or Obama, or
> both. I just do not understand. Do you? I don't.
>
> Next time you see Hillary, you can ask her if you can open up the
> front of her chest cavity, and take a look inside to see if she has a
> shank, as I described it, or if she has a twisting and turning, animal
> type set of guts, like many animals do. I think you'll find that she
> has a 'shank', and not a twisting, turning, animal set of guts.
>
> All human beings have shanks, and not one human being has a set of
> 'animal' guts. Human beings have shanks for fuckaling, that is, butt
> fuckaling, but no one, except the Lesbianists, know about it, and as a

> result, no one ever thinks about butt fuckaling, as a type of sexaling enjoyment, and a sexaling past time.
>
> Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr. Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All The White House Staff, Etc.
>
> Well, I have told you about many bombs you can make, on my web site, and I suggest you begin to think more seriously about taking out Hillary's cavalcade of automobiles, next time she is riding through Washington DC. Or the next time you see Mr. Obama, please consider blowing his cavalcade of cars and limousines, up and out of the upper solar atmospheres, with the bombs you can make, as already explained about, in my notes, on this bulletin board.
>
> After you blow them up into bits, and pieces, they will be fine, as they will soon be coming out of my Epcot Center, as tummy babies, and they will be two less threats to the ordinary and normal people on this planet, for some time to come.
>
> A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A Number Of Other Lesbianists
>
> Before you blow up Hillary, find out if she is with us, on this, or what. I think Mr. Obama is not with us, yet, but it may be the case that Hillary Clinton, along with a lot of her friends, is now on board, and she is hoping to set sail with the rest of us, but is not quite able to break away from the Lesbianists' and their organization, since she has been a friend with them, and a member of their organization for umpteen millions, billions, trillions, and zillions, plus years, since long before they ever even came to this planet, to settle it. These people, Hillary Clinton, and a number of her friends, are ready to make the change over, but lots of Lesbianists are not ready to make the change over, and so Hillary Clinton is kind of stuck, and so are all the other Lesbianists, who want to make the change over, and who want to say good bye to their former organization.
>
> In any case, this planet is crawling with animal people of all kinds, as I've mentioned, and it is a very unpleasant situation, and the Lesbianists know this, as most of their membership has already been eaten up by animal people, and there are many types of animal people. Many of the animal people who ate up the Lesbianists below ground, are walking around, as they imitate, or take on the form of human beings, after they eat one. Not many of the original Lesbianists are still alive, down below the surface of this planet, in their underground cities, as I've recently learned, as most all of them, close to ninety nine plus percent to nearly one hundred perecent of the Lesbianists down below the surface, have already been eaten up. There are still a lot of Lesbianists down below us, below the surface, but compared to the numbers of them who were there, before, there are fewer, now.
>
> What To Do, Now?

>
> I thought my kids were ready, with an underground system of 'safe harbors', but it seems there is a delay, and I'm not sure when the delay will be resolved. Until it is resolved, I guess we are stuck where we are. So, the only thing to do is to get the government to make the needed changes, and to step up to the microphone, and denounce the Lesbianists organization, by telling every one that it exists, and that we will now build a one world, government. When the politicians decide to do that, and when we begin building a one world government, then maybe we will begin to see some resolvement to this situation.
>
> I have some more ceremonies to do, and I have a lot of time to wait, till we see a resolvement to this situation. The additional ceremonies will assist us in making a safe harbor, as far as I have heard, that is fully integrated, and that has all the protection and safety systems that will be needed. All the different components to the fully integrated system, for covering our immense universe, all at the same time, are not available, yet.
>
> There is a lot to learn, about who else lives in our universe, and about where my kids live, and about what my kids do for me, keeping my universe running for me, along with a lot of other information, for you to get and read, and then understand, about my kids.
>
> As soon as the local, or federal governments around the world release the software that will allow people to upgrade to the 'Managing My Universe' software upgrade, from the databases, that are located in the underground bunkers the Lesbianists used to use when they first arrived, and when they were in the 'sexaling for a living' program, which all of them were in, when they arrived. These databases are also located on other planets where there are bunker systems, and where there are communities of people, who are in the 'sexaling for a living' program.
>
> Also, once the 'Managing My Universe' program software is released, and once people start using it, and once they set up their own network, that it will run on, and once enough people are running that software on their computers, we can have a partial soluition to the problem of the animal people, as well as a partial solution to dealing with Mormons, and Clerics, and Protestant leaders, who believe in "Jesus Saves" and other such useless nonsense.
>
> I think the Jesus Saves group, i.e., Christianity, the Mormons, Protestants, Lutherans, Catholics, Presbyterians, and so forth, is built on Islam, and on Judaism, or rather, on one of the schools of Judaism, plus maybe some other things, made up, or grafted from other religions that were primitive religions, such as Voodoo cults, and worship of the dead cults, as well as other cults, and they were all squished together, and the result was, "Christianity", but that was after all of my teachings were clipped out of the two above mentioned religions that I had taught.
>

> In any case, not a one of them has a clue that sexaling is a 'purifying' activity, and women and their sexaling bodies are like 'purifying' engines, or washing machines, as I've mentioned before, and men and their sexaling bodies, are also capable of becoming 'purifying' engines, and washing machines, though we all have our karma, and it will be a while before we erase enough of our karma, to make a difference, for some of us. That means, some people are better able to sexal than others as their karma for sexaling is better for sexaling than the karma for sexaling of others. We have a lot of karma to erase before we all begin to pick up enough steam to get any where, sexually speaking.
>
> I think that is the general situation, for most, but there are some people who are more gifted than others, and there are some people who are, when it comes to their sexaling capabilities, generally speaking, fine.
>
> With the use of aphrodesics, fruits that we can grow, that must be taken off the 'banned' foods lists, vegetables, nuts, and other foods that also are useful aphrodesics, that must also be taken off the banned foods lists, we will be able to make better progress. Sessame seeds can mold up wheat bread to make a nice aphrodesic, from what I've heard, and I will give it a try, one of these days, as I'm busy, molding up a few other things, first, sort of for experimentation, as this is all new to me. Peanuts supposedly, might be aphrodesic, once you mold up wheat bread with them. I believe they have minor pain killing properties, as well. Dark green garbanzo beans, sold in Indian food markets, also mold up wheat bread and are useful as aphrodesics. White bread is too poisoned to consider for use. Please use only whole wheat bread, or a bread of fine quality. Do not use white bread or normal white french bread, as the flour used in making them is treated with bleaching agents, that are poisonous.
>
> ### Compliance With The General Terms Of Their Settlement Agreements
>
> In any case, we need all the laws changed, as I've mentioned about, before, and we need the governments to form a united, single planetary government, and we need every one to begin to get the information they need, and the assistance they need to begin to cooperate with each other, in science, and in agriculture, and farming, etc. We need to ban pesticides, the use of petro-chemicals in the manufacturing industries, the promotion of natural fibers, and natural oils for manufacturing, and the switching over to non-polluting, hydrogen based technologies, and so forth.
>
> We also need the volumes of Greek literature released, as well as all the other literature, that needs to be released, that the initial settlers of this planet, were given, to use to set up their planetary government, with.
>
> When we start to see that these and all the other neccessary steps are being undertaken, in an effort to accomplish them, we will be in a better situation to begin to see a resolvement to this situation. The

> Lesbianists do not like to be forced into doing things, but in this case, there is no other way of getting these things done, and so if we need to force them to get them to move off their fannies, and get their butts in gear, than we will have to do just that.
>
> We need the Lesbianists, and all the other groups of people on this planet, who legally, or rather, legitimately settled this planet, but who are not in compliance with the terms of their settlement agreements, get into compliance, and the sooner they get into compliance, the sooner we will have a resolvement to this situation.
>
> Persons Who Wish To Participate In The Previous Sexaling For A Living Program
>
> I have talked about the previous sexaling for a living program, that people were signed up with, a long time ago, when they first settled this planet. I mentioned the underground bunker systems, that my kids still keep for eligible card carrying members. I suggested that there might be people who died, and after they came back from the Epcot Center, they no longer knew any thing about the 'sexaling for a living' program, that they were affiliated with, and they forgot that they were a valid card carrying member of the program.
>
> Even though these people, may not remember that they were once in the program, since they don't usually bring that information with them, when they are tummy babies, in mama's tummy, these people, if they wish to get back into the 'sexaling for a living' program, that they were once a participant in, they may write a statement, and state that they wish to get back into the 'sexaling for a living program'. They need to sign it, and press their energies into it, just as I explained, about, before. For example,
>
> Affidavit
>
> I, ____name____ would like to get back into the sexaling for a living program, that I was an active participant in, previously, and that I continue to belong to, as a valid card carrying member.
>
> Signed: (signature)
> Date: (Date)
>
> Then, press your finger, or thumb, or elbow, or toe, or nose, or lips, or palm into the paper you wrote, above your signature and date area, and make sure you press in your energies, as well as you can, and that should wake up my kids, and get their attention. When my kids have verified that your request is legitimate, they will buzz you in, or rather, teletransport you into the underground bunkers, that still exist, in many places, on this planet, and under the surface of this planet. These bunker systems exist on other planets, as well, and so every one who is qualified, no matter where they are, and no matter what planet they are on, can get back into the program, so long as my kids authorize and approve their request for entry into the program.
>

> This will get you started. You have to be certain, that you wish to start off, again, and that you are sincerely interested in getting back into this program, to sexal for a living, in accordance with the rules and guidelines of the original program.
>
> Once you are in the original program, now as a participating member, you can begin sexaling for a living, and you can also, begin to study about the new 'sexaling for a living' program, and the 'managing my universe' program, and the other programs that are now available, in the Gurkian Age. There are introductory courses for people who are not familiar with the program, and your questions will be answered in the seminar like introductory courses.
>
> Once you decide to join with one or more of them and once you decide to get into the Gurkian Age Religious Revolutionary Movement, and then begin sexaling for a living, as you get fit, and healthy, by your participation in these and other activities, as well, such as the club activities, as I've mentioned about, before, so that you can sexal more adequately, and robustly, for, eventually, days, then weeks, then months, then for years on end, without tiring out, too much, and in between sexaling activities, you will have lots of other activities, such as the club activities, to vary the pace of your life, to make it more interesting, and more engaging, by meeting with lots of people in the clubs, and by learning about these people, and by sexaling with them, once you've decided you would like to join, then you can switch over to the new programs, in the Gurkian Age Religious Revolutionary Movement, and get started when the facilities for them, are constructed by my engineer kids, and by others of my children, who will be helping them.
>
> When we have all of the facilities needed, the new programs will open, and you can switch over to the new programs and my kids will help you with the paper work to transfer over your membership to the new programs, in the Gurkian Age Religious Revolutionary Movement.
>
> Qualified Card Carrying Members
>
> Some of the people who I've mentioned before, such as Jodi Foster, Jennipher Lopez, Madonna, Angelina Jo-li, Jack Nicholson, Angelica Huston, many actors in the New York actors' guild, many members of the west coast actors guild, and many members of actors guilds around the world, and also, many members of dance troups, and dance guilds around the world, singers, musicians, entertainers, members of the military, members of law enforcement agencies, and so forth, many of these people, and others, as well, are qualified as valid card carrying members of the original sexaling for a living program, that the initial members and follow up members of the out bound programs for the settlers to this planet, were all a member of.
>
> Even if you do not think that you could possibly have been a member of one of those out bound settler's programs, you may have been one, and if you write an affidavit, in the form as I've mentioned above, you may find that in fact, you were a member of the out bound program of

> settlers to this planet, or, you may find that you were a member of
> one of the other out bound programs, to other planets, and you may
> find that you are still a qualified, card carrying member who is
> entitled to rejoin the sexaling for a living program, that you were
> once a member of.
>
> How is this possible? How can you still be a valid member, after all
> this time? Well, it is just that we need to get you started, and so
> these facilities, the underground bunker systems, that I've mentioned
> about, before, are there, and I was told by my kids, that you can make
> and sign a statement, or an affidavit, in the manner in which I
> mentioned, above, and that will be all you need to do, to get back
> into the program, you were once in. We are extending the time limit on
> the previous sexaling for a living program, as a short term measure,
> to help get things started up, again.
>
> Zealot
>
> Joining the original program, applies to all valid card carrying
> members, whether they currently know they are with an out bound
> settler's group, or not. That means, that Ms. Hillary Clinton, can get
> started up, again, as the time limit on the program has been extended,
> and so can Mr. Bill Clinton, and so can Chelsea Clinton, and so can
> all of the other people, who prefer to consider them selves as
> 'radicals', and they prefer the term, 'Zealot' as in, a person who has
> a lot of zeal for living, to the term, 'Lesbianist'. So when you see
> some one you might recognize as a possible 'Zealot' it is polite to
> use the term, 'Zealot', and not use the term, Lesbianist, as
> 'Lesbianist' has too many negative feelings attached to it, and people
> might start using it as a way to make others, angry.
>
> You do not get points, for starting fights, or for getting other
> people angry at you, for teasing them, and so forth. So, let's all
> behave, and let's all get into the program, those of you who are
> eligible, and let's go from there. If you have a friend, who might not
> be eligible for the program, you can make an application to allow the
> person into the program, and then my kids will approve it. The person
> will then get accepted into the sexaling for a living program for the
> out bound settlers.

>
> What Is Tin
>
> Tin ore is a metal ore, and it is found in cassiterite, as listed in
> many books, and it is also found in iron pegmatites.
>
> Iron pegmatites are its chief source for supply of this mineral ore.
> It is like gold, or barium, or silver, and it is found in many
> pegmatites.
>
> What is barium? It is a mineral that is found in steel ore, or iron
> ore, and it is a tough metal, and it is very strong, with great
> tensile strength.
>
> What are pegmatities?
>
> Pegamatites are large stones that contain mineral ores.
>
> A pegamatite ore stone can be found in silver deposits, and in gold
> deposits, and in many types of mineral deposits.
>
> Pegmatites are generally found with quartz, or a type of quartz, that
> is a pearly white in color.
>
> It is a cluster of ores, of various types, and the ores can be any
> thing from silver, to gold, to iron, to boron, or cadmium.
>
> What is boron?
>
> Boron is a chief component of the metal industry, and it is used for
> making steel. It is found in iron deposits, and it is also found in
> gold deposits. Boron is a chief component mineral ore found in iron
> ore deposits.
>
> What is cadmium?
>
> Cadmium is also a chief component of the metal industry, and it is
> found in large quantities, when found with silver ore, and with iron
> ore, and with gold ore, typically. It is a shiny grey ore, and it is
> very useful for making steel stronger.
>
> The processes of melting tin ore out of cassisterite, is a difficult
> process, but the Lesbianists use it to help confuse people about what
> tin is. Tin is chiefly found in metal deposits, or metal bareing

> loads, where there is much iron ore, and steel ore.
>
> Steel ore is similar to iron ore, but steel ore is stronger than iron.
>
> Iron is a little brittle, and with out the use of steel ore, and with
> out the use of other ores, to stiffen it up, iron ore is a poor choice
> for durable, pots, and durable cast iron statues as it will fragment,
> very easily, and it turns to dust, if scraped with a strong hardened
> steel knife blade.
>
> The home hobbyist, or workshop metal smith, as seen on PBS, the small
> sized smelting industry, as seen in a recent Las Vegas PBS program
> that touched on metal smithing, makes a big deal out of white metal,
> and that is iron, basically, the real brittle metal that comes in
> through the metal smith's doors from people who own statues made of
> iron. That brittle metal, if scraped with a knife, will start to
> shatter, and fall apart, and the metal smith was saying, he could not
> weld any thing to it, as it would just keep coming apart, layer after
> layer. That is iron ore, and it is different from steel ore.
>
> I suppose the Lesbianists' made up the periodic table of elements to
> help confuse scientists, and it does not jive with reality, and the
> metals animals minerals animals, elements animals, and other animals,
> that we have in our environments. The Lesbianists periodic table of
> 'elements' does not help to describe the many types of 'elements'
> animals and other animals that we find in our environments, under the
> ocean, in the forests and jungles, under the ground, or in the
> deserts, and so on.
>
> How Many Elements Animals Are There?
>
> There are so many elements animals, you will take many years to study
> about them all, if you decide to study in depth about them. Maybe it
> will take several hundreds of years, to learn about some of the things
> about them. If you wish to study about all the mineral animals, metal
> animals, elements animals, and other living animals that are in my
> many universes, it will take you a far greater amount of time to study
> about them all.
>
> We will have courses for you to study about them, once we set up our
> new civilization, and once we get around to setting up the many other
> new civilizations, that will all be patterned after our civilization,
> that we will be setting up, shortly, with the cooperation of the
> Lesbianists, the Zealots, and their many other outbound planetary
> settlement groups radical friends.
>
> New Sciences
>
> Elements animals are many types. There are thousands, and millions of
> elements animals, if not more, maybe many times more, into the
> kazillions, plus many times more, I think.
>
> Just like animals on the ground, or in the ocean, or in the fresh

> water lakes, or in the sky such as birds, or in the lagoons, or in the
> swamps, and so forth, there are untold, countable numbers of different
> animals.
>
> However, the elements animals are very far greater in number, than the
> animals we can see with our eyes.
>
> Animals of all sizes, and some of them are very tiny, exist in huge
> numbers, all throughout my universe.
>
> Tree animals, and plants animals, we learned about recently, the
> drafts babies, and the wedger mama's, they are in each and every
> plant, and they are different from every other type of plant animal.
>
> There are quite a large number or plants, and flowers, and bushes, and
> sea weeds, though we don't see sea weeds too often, or kelp plants,
> but there are lots of underwater plants, but perhaps not as many as
> above ground plants, as we have destroyed our environments, and in the
> ocean, the oceans are so polluted, not much grows in them, any more.
>
> Elements animals are very large in number. So are molds animals. Molds
> animals are very large in number, but who is there more of? I don't
> know, but maybe with all the different types of molds there are, there
> may be more molds animals, than there are elements animals, but it is
> a close call, I think.
>
> But maybe not, as there are so many types of animals in molds, maybe
> the animals found in molds, are far greater than the number of animals
> found in elements.
>
> Anyway, I suppose molds animals, if we look closely at all the
> different types of molds there are, with a microscope, will far out
> number the number of elements animals.
>
> Never the less, there are a far greater number of elements animals,
> than the Lesbianists are going to let anyone know about.
>
> Why is that? It's because they do not want to educate people about the
> real world we live in. They want to keep us dumb, and stupid, so they
> can laugh at us, or at least, as dumb and stupid to them, anyway, so
> that they can laugh at us.
>
> Well, it is a pretty unpleasant situation, here, because we have to
> learn what science is, and we have to learn the real sciences, and not
> the phoney sciences the Lesbianists teach.
>
> My memories are not good enough to even begin to teach any thing, but
> any way, we need some Lesbianists, such as George Bussey, or Clint
> Eastwood, or Morgan Freeman, and Liz Taylor, and Mila Jovovich, and
> Mrs. Barbara Bush, Jr., and Mrs. Barbara Bush, Sr., and Mr. George
> Bush, Sr., and Mr. Ronald Reagan, and Mr. George Bush, Jr., and their
> radical friends, to teach us the real sciences, along with the rest of
> the Lesbianists, or Zealots, all of them.

>
> Not a lot of them will want to comply, with that, but we can get some of them to comply, if you make friends with them, and then invite them to your houses, and sexal with them, and make them your best friends, and your sexaling partners. The longer you remain friends, and the longer you sexal with each other, the more compliant they will become over time.
>
> That's the best way to get the Lesbianists, or Zealots to become your friends and then have them teach you stuff, about molds, and science, that you didn't know about, before. As you learn about science, you will learn about making molds, using different methods, and then you can learn how to feed your body, and then you can learn how to feed all the organ animals in your body, a proper diet, and then you can live forever.
>
> If your organ animals all get the foods they need, you will have many happy animals inside of your body.
>
> Professional Moldists
>
> Lesbianists are all professional moldists, and they all have the capability to teach people how to mold up any thing that is worth molding up. They study for millions, and billions of years, and even longer, in some cases. They get their professional degrees, and then they qualify for the outbound settlers' program, and then they go off to settle a new planet, that has not very long ago, recongealed, after it was last smashed apart by a passing sun, or large planet, traveling at a very high rate of speed as it smashed into it, or as it smashed into something, such as another planet, or even a sun, nearby.
>
> That can be very catastrophic, and not many people will survive, and many planets in the vicinity, will shatter to pieces, when a sun or large planet is hit by direct impact, by a large size planet, or fragment of a large planet, or a sun, or fragment of a sun, traveling at a high velocity, near or even past the speed of light.
>
> The shock waves that go shattering out, in wave after wave, will destroy every planet and sun, for a long ways around.
>
> This happens, some times, and the planets and suns and moons, are reduced to dust particles, and after some time, they begin to recongeal, as they go spinning around due to magnetic waves that affect them. After spinning in various formations of circular movements, they eventually recongeal into numerous planets, and many different sized suns. Lots of moons also form, and you have the birth of a lot of new planets, that need settleing.
>
> We always send out people to settle the new planetary systems that need settling, who are most qualified, to establish and lead a new civilization, that they must construct, as a part of their agreements, for their being selected to settle the new planets.
>

> This is how it is typically done, and so we get the best and the
> brightest, and after their certification, they go out to settle a
> newly formed area of planets that are habitatable.
>
> We send out many groups, one after another, of highly qualified
> people. Hulk Hogan was one of those people, who came in a different
> group of people, but he is friends with the Lesbianists, and he
> supports, more or less, what the Lesbianists are doing. There are a
> lot of Hulk Hoagan's friends, who also came and settled this planet,
> in one or more of the out bound planetary settlement groups.
>
> We need Mrs. Barbara Bush, Mr. Hulk Hoagan, and all of their friends,
> including Hillary Clinton, and Mr. Obama, to get into compliance with
> the terms of their agreements, that they initially signed onto, and
> penned their names to, so that we can get further aide from my
> children.
>
> My Working Children And Where Are They?
>
> My working children take care of the support work, once the settlers
> in the out bound settlement groups are in agreement with the terms of
> compliance, of their out bound planetary settlement program.
>
> How this is done, takes some explaining, but it is fine to leave it as
> it is, for now, as it will take a lot of explaining to do, to let you
> know exactly how every thing in my universe is set up, and where all
> my kids are living.
>
> There are multiple dimensions to this universe, and I weaved together
> this universe, in such a way as to support the activities of my kids,
> and at the same time, support the activities of other groups of my
> kids, living in different dimensions, and at the same time, support
> the activities of us, living here, in this large universe of ours.
> This is the central area for us to live, and we have a different job,
> as it turns out, and that is to purify our universe that we live in,
> for eternity, so that we can all live in all the universes I have
> made. There are many universes, too small for you too see, as you are
> just too big to possibly see them.
>
> I also made many dimensions, and weaved every thing together, in such
> a way as to support the religion that I am now going to teach to you,
> over time, and that you are all going to learn about. You can decide
> for your self if you wish to practice my religion or not, but your
> practicing my religion, is essential for us to have a nice place to
> live in, for eternity. That also includes all of my kids.
>
> Different Jobs For My Different Groups Of Children
>
> We have a lot of different jobs to do, my kids, and you, and to keep
> every thing running smoothly, we must practice my religion, that I am
> now begining to wake up to and learn about, as I come out of my
> condition of amnesia, and that I am now begining to practice, in my
> apartment.

>
> This is how I planned, it, with me waking up, and coming out of my amnesia, and then, over time, introducing my self to all of you, as you all begin to practice my religion.
>
> We will be here for eternity, and it is our job to purify our universe, and to erase the karma, that is a continuous problem, for all of us. There is much we must understand about how my universe is built, maintained, and run or managed. All of my kids make karma, and to keep this universe running properly, we have to divide the karma up, into manageable sizes for each one of us to bare. We are in the best location, here in this universe that we live in, and it is our responsiblity, because we it is our job, to keep our universe pure by practicing my religion.
>
> Advantages To Living In This 'Central Bus Station Terminal Building' Universe
>
> There are lots of advantages to living in this universe, the 'Central Bus Station Terminal Building' universe, that my kids do not share with us, as they live and work in their many, tiny 'Bus Station Terminal Building Support' universes, to support what we are doing, in this 'main' universe. There are lots of things that you can do in this 'main' universe, efficiently, and effectively, that you can not do as well at, in the tiny universes that my kids live in.
>
> The list is long, but one thing is, taking karma, and figuring out how to deal with it, and then dealing with it, efficiently. Another thing is, balancing out karma. We need to balance out karma, to keep every one and every animal alive, thriving, and well, and we can effectively balance out karma, in this 'main' universe, better than in the tiny universes that my kids are living and working in.
>
> With my religion, that we will begin, soon, to accept and practice, some of us in our universe, and in time, more of us, and with my kids practicing my religion, along with us, but in their support network of tiny universes, and more needs to be explained about the support network of tiny universes and what my kids are doing, as they work in them for keeping things running smoothly and harmoniously, we will effectively have a way to balance out karma, much better than ever before.
>
> Practicing my religion is also good for erasing our karma, and we can more effectively erase our karma, and keep things running smoothly, for our 'main' universe, as well as for all of the many support universes, that my kids are living in and working in, and that we need integrated with our 'main' universe, to allow us all to live in this very big universe of ours, which includes and is central to all of the other many 'tiny' universes and central to all of the other living areas, that goes on, beyond the walls of this universe, in all directions for almost nearly infinity for all practical purposes, that I have for all of my working kids to live in and work in, supporting what we are doing in this universe and supporting, in an inter

> networked and inter connected manner, what they are all doing, in their universes, and living areas, as well.
>
> My human being kids all have jobs, and so do all my worker animals, and I have lots of working kids, and I have lots of worker animals of all different kinds.
>
> You and I, who are in this main 'Central Bus Station Terminal Building' universes, are the only ones who do not have jobs assigned to us. Therefore, we are all going to work, forever, from now on, at practicing my religion, and this will be our primary job, for keeping our universe running, and for keeping all of my kids universes and living areas, running in proper order, as we erase the massive amounts of karma that need to be erased and as we balance out the massive amounts of karma that need to be balanced out.
>
> This is a difficult and lengthy topic to discuss, and so I'll have to leave it for another day. Sorry.
>
> In any case, we all must have a job, all of my kids and I, and now, of course, you are all going to join my kids, whether you like the idea of it, or not, and begin working for me.
>
> Getting Into Compliance Of The Outbound Settlement Program
>
> Mrs. Hillary Clinton, Mrs. Barbara Bush, Jr., Mrs. Barbara Bush, Sr., and all their friends are now going to have to get into compliance with the terms of their aggreements for the outbound settlement program. Once they do that, we can begin to get things started, for the rest of eternity, with you practicing my newest religion.
>
> This religion will take the best from each of my earlier religions, that I taught, and combine all of the best of them, into this one. There are also some other special features to this religion, and we'll learn them over time.
>
> In any case, we are going to place women in their rightful place, above men, and we are going to place men in their rightful place, below women. That's one of the main things that we are going to achieve with this new religion. It was never a big issue, before, in I think maybe most of my religions, if not almost all of them, where women stood in relation to men.
>
> Anyway, we are going to get an understanding of the fact that there are two races of people, and one of them is the female race, and one of them is the male race.
>
> That's one of the primary things, that we are going to get straightened out, now, with my religion, with out ever getting it confused, again, for the rest of eternity.
>
> In any case, we need all of the friends of Hillary Clinton, Bill Clinton, Chelsea Clinton, George Bush, Jr., Barbara Bush, Jr., George

> Bussey, Mila Jovovich, Bruce Willis, and of Hulk Hogan, and of all of the other people who came in the original outbound planetary settlement groups, who are still here, and still alive, and who still remember that they all have planetary settlement agreements to get into compliance with.
>
> Unless they do that, there is not much we can do, except wait around until they finally do decide to get into compliance. They must then take the neccessary steps to inform every one, about the facts of this situation.
>
> ## The Planetary Government And The Laws For The Citizens Of This Planet
>
> Until they do that, we can not get much work done, as all the laws, and the way the societies on this planet are set up, will not work for us. Nudity and nakedness must be permitted, and so must public sexaling. All forbiddance laws must be dropped, and all laws on behavior, and the types of plants people can eat, and so forth, must be all dropped.
>
> The sets of laws that are the basis of the outbound planetary settlement programs must be then instituted. The governments that the Lesbianists have set up, must be dropped, and one planetary government must be formed with those laws as the foundation for all of the citizens of the planet.
>
> Those are the first steps that we must take. After that, we will get and have the needed arrangements, to set up my religion, globally, so as to make it accessable to every one.
>
> We are also waiting on the release of the software and operating system, that I released to the FBI, through their twenty four hour a day, audio and video surveilance of me, which I've talked about, before. When that software and the operating system are released, we can begin the 'managing my universe' program, and the 'sexaling for a living' programs, that will then be instituted, after the Lesbianists and their friends, get into compliance with the terms of their agreements.
>
> Once they get into compliance, and once we get the software from the tapes of the video surveilance, we will be able to institute the 'managing my universe' program, and the 'sexaling for a living' programs.
>
> Until then, there is not any hope for any meaningful change. So, until then, please make friends with the Zealots, or Lesbianists, and their friends, and become good sexaling partners with them, and get them to teach you more about the real sciences, and about molding sciences, etc., and make good relations with each other. It may take some time to get their attention, and to get them to begin to accept your offers and invitations to your homes, or to their homes, on occaision, for sexaling sessions. After sexaling for several weeks, non stop, they will all become more pliable, and more compliant, and they will begin

> to loosen up, and then open up and talk about things, as you all begin to learn to trust each other, and to treat each other with care, consideration, and respect. You can then begin to build on your understanding of each other, and your relationships with each other, will begin to blossom.
>
> ## Sexaling Professionals
>
> The Zealots, and their friends are professional sexalers, so they can teach you many things and secrets about sexaling, that you may not know about. You will make good bed partners, and after some time, you can learn lots of things. There are cures for herpes, of course, and for genital warts, and for all venereal diseases, and so forth. These Zealots, the Lesbianists, know all about them, as they had to study all of that stuff, to get qualified and certified for the outbound planetary settlement programs. You will also be able to learn proper diet techniques so as to be able to feed your body, and all the organ animals, and other animals, that are living in your body, and that you need to feed. You can also learn proper skin care, health care, and body hygene.
>
> ## Wedding Arrangements
>
> Currently, the way things are set up, with one person, a male, and the other person, a female, getting licensed to marry each other, will not work, under the new system. Thus it is neccessary to get into compliance with the terms of the outbound planetary settlement programs, so that the new laws will allow for multi person marriages. Multi person marriages, I discussed, before. Women and girls need multiple men and boys to sexal with, properly, as women and girls are very capable sexalers, once they learn how to sexal properly. Multiple person marriages will allow for mulitiple women and girls, and multiple men and boys, to marry each other. The current laws must be dropped, and the current governments must be disbanded. After that, the new government and the new laws will allow for multiple person marriages. Once multiple person marriages are allowed, after the new government is set up, then the sexaling for a living programs, will be instituted, as a part of the compliance terms.
>
> ## Informing The People Of This Planet About The Terms Of Compliance
>
> The Lesbianists need to inform every one about what the terms of compliance are, and they had better get to that, soon. They must then, with their many friends, who came after them, or along with some of them, as they arrrived on this planet, by space carrier, or space ship, begin to get their Lesbianists friends in all the governments of the world, and their other friends in the governments of the world, to comply and participate in setting up the one world planetary government.
>
> The software and operating system software, have in them, access capabilities to access data bases, to down load all of the information, that is needed for every one to learn about and to begin

> participating in all the new programs.
>
> Building The Infrastructure, And The Needed Facilities, Etc.
>
> Once you begin accessing the databases, and once you begin to study,
> and learn about the new programs, my kids, who work in other
> universes, and in other dimensions, will then begin to build and set
> up the infrastructure, housing, food production facilities, medicine
> production facilities, recreational facilities, academic facilities,
> hospital facilities, prison facilities, and so forth, that will be
> needed to further advance the programs every one will be required to
> begin and will need to begin to participate in.
>
> Once we get to that point, we will begin to be able to have a stable
> society, with all of the new technologies that will be provided for
> security, and personal safety.
>
> Molding Up Bread And Metals Animals, Etc.
>
> I said, before, that you need only a square inch or so of metal in
> each one gallon of bread you are molding up. That may be a minimum,
> but it is better to use more. If you are using a plastic container,
> you can line the bottom of it, with aluminum foil, and you can line
> the in side walls of the container, up to one half to two thirds up
> towards the top, for better results.
>
> Some molds animals like silicas. Some like quartz. Some molds animals
> like tourquoise. And lots of them, like various mixtures of minerals
> and metals, and elements animals, as well as other animals, we do not
> know much if any thing about, who are hiding inside of rocks, and
> stones. Anyway, we'll find out, in time, all about what molds animals
> we are trying to make, and what they like to eat, and then we will
> find the right types of rocks, ore rocks, mineral rocks, and other
> types of rocks and stones, and we will provide them to the molds
> animals, and funguses animals, so that they can get fed well. The more
> well fed we feed them, with all of the many types of worker animals of
> mine, the healthier they the molds animals and funguses worker animals
> of mine will become. The more healthier they become, as we raise them,
> in the containers we find to farm them in, when we are finished
> farming them, and then when we eat them, the more healthier the organ
> animals in us, will become.
>
> The more healthier the organ animals in us become, the better able
> they will be to make babies, and the more successful we will be at
> prolonging our longevity. Our bodies are meant to last for eternity,
> if we feed them with the right worker animals of mine, and all the
> proper foods and nutrients they need to stay healthy. We have much to
> learn about all of this, and the sooner you begin making friends and
> making sexaling partners with the Lesbianists, and their radical
> friends, the sooner you will be able to begin to understand how to
> feed your bodies, properly, so that you can begin to live forever, and
> so that you can begin thinking about working for me, in this main,
> Central Bus Station Terminal Building that we are living in.

>
> What Will Be Your Main Jobs From Now On?
>
> It might take you awhile to decide to begin working for me, but the sooner you decide, the better off we will all be, as we need all of the wonderful sexaling energies you and your sexaling partners will be helping to create, to fill up this universe of ours, and to fill up all the many universes of my kids, and all the living areas of my kids who live outside this 'Central' universe we are in, which is a very big place, as I've mentioned about, before. It is very hard to fill up this 'Central' universe we are living in, with all of the wonderful sexaling energies, that will allow us to begin to breath, easier, once again, and that we are starving for, and that we are currently depleted of.
>
> We will, though, over time, fill up this whole universe, and all of the many other universes, and areas my working kids live in, with all the needed sexaling energies animals, and other types of energies animals, we do not understand too much about, and that we also have to study about, one day.
>
> My working kids are all doing their best, sexaling for a living, so that they can erase their karma, and balance out their karma, in addition to working at their main support jobs.
>
> Those of us, you and I, in this main, 'Central Bus Station Terminal Building' do not have any support jobs, so we will have lots of time, for the 'managing my universe' programs, and for the 'sexaling for a living' programs so that we can also erase our karma, and balance out our karma, as well as erase all of the karma of my worker animals, and also, help balance out all the karma of all of the worker animals of mine.
>
> That is your main 'job', from now on, sexaling for a living, as well as working in the 'managing my universes' programs.
>
> We will have lots of time to study about every thing we need to and want to study about, so we can better understand the many things we need to learn more about, so that we can appreciate what my working kids are doing, to keep all of the many tiny universes, and all of the living areas, as well as our universe, in proper working order so that you can all live and work forever, as one big family of children.
>
> There is much more to learn about, with regards to my family of children, and about all the new human being kids we will be greeting, and welcoming into our large family, as the ladies and girls begin to bring them into our 'Central' universe, as tummy mommies, along with the tummy daddies, and we will learn more about the many new working kids of mine, that my working tummy mommies kids and working tummy daddies kids, will be bringing into, and welcomeing and greeting as they come into each of their universes and living areas, another day. We will also be seeing many new worker animals of mine, over time, as many, many new ones, of all types, will also be joining the working

> force of my worker animals.
>
> ### Getting Busy, Cleaning Up, In The Gurkian Age
>
> It will take us a long time to get every thing into good order, and to clean up our universe, and erase our karma, and balance out our karma, along with my worker human being children, who are all busy, cleaning up the many support universes that they live in, and cleansing their karmic records, etc., and who are all busy, cleaning up the many support living areas, that they live in, and cleansing their karmic records, etc., as they begin to practice, more and more, my new religion for the Gurkian Age that we are now in and at the begining of.
>
> This may sound hard to believe, or 'fictious', but it is not 'fictious', and over time, you will learn all about every thing in detail, and you will begin to get your selves grounded in reality, more and more, as you begin to work in the 'managing my universe' programs, and as you begin to work in the 'sexaling for a living' programs.
>
> ### Taking The First Steps Towards Resolving Cooperation Issues
>
> Making friends and becomeing sexaling partners with the Lesbianists, the Zealots, and with their radical friends, is your first step in the correct direction towards resolving the difficulties we are encountering, now, to some extent, because of the Lesbianists, and their radical friends reluctance to cooperate. The more friends you make and the more sexaling partners you make, the more the Lesbianists and their radical friends will begin to 'cooperate' with you, in all the ways that are important to resolve the cooperation issues, and non cooperation issues, that are currently in need of resolving.
>
> ### Air Raid Shelters And Play Time 'Fetish' Sexaling Underground Dungeons
>
> People with underground air raid shelters, may wish to add on to them, and expand their size to accomodate all the new friends from among the Lesbianists, or Zealots, and their radical friends, who people with underground air raid shelters, or other convenient places, underground, such as play land dungeons, which some people who like fetish sexaling, may have, will be inviting in to their underground air raid shelters, for a long duration stay to have the Lesbianists, or Zealots, and their radical friends, teach them about sexaling, and teach them about molding, and the sciences that these people know nearly every thing about. Almost one hundred percent of the course work had to be completed, and in many cases, it was one hundred percent of the course work that needed to be completed, to make them an eligible candidate for an out bound planetary settlement program.
>
> ### Becoming Trusting And Loving Friends With Each Other
>
> As you invite these people into your homes, you will need proper accomodations, such as extra rooms, and extra beds, and so forth, so

> people with underground air raid shelters, and with underground fetish sexaling rooms, or dungeons, will need to expand the size of these underground rooms, so as to accomodate all of the guests they will be inviting in, to meet and sexal with the family, the relatives, the neighbors, and other trustable persons.
>
> You can learn many secrets about sexaling, and you can learn a lot more, than you would imagine, as all of these people were certified as instructors for teaching sexaling techniques, judo and ai kido techniques, as well as impromptu ninja type, assasin techniques, for use in a pinch, to protect their lives. They were also certified to teach molding sciences, and all the earth sciences, and planetary science, all the math sciences, and so forth. They were also trained in government sciences, nutritional sciences, medical sciences, and so forth, so they could be all around, professional, well trained persons. All this training was for the bright of the brightest, and they spent many hundreds of thousands, and millions of years, and billions of years, and some times, more, training and getting certified in all the career sciences, as well as in fitness and health sciences, that they needed to learn to set up a new civilization, with a fully developed government, in accordance with the instructions and requirements for that government, which was to be based on the same pattern of government, where they trained to become certified officials on the planet they were to settle, and in the galaxy they were going into.
>
> They were trained to be excellent leaders, and capable people, in every sense of the word, to get and hold the attention of all late comers, and to prevent the late comers from attempting to dislodge them, from government, over some petty, dissatisfaction, about their performance. Their performance issues were of major concern, so they were highly over qualified, so as to make it clear to all late commers, people who would be arriveing later, either as new additions to the population, on the out bound planetary expeditionary settlement program, or as tummy babies, to tummy mommies, and to tummy daddies, who they all new they were going to become.
>
> They are so well trained, they can teach you practically any thing, not only with regards to medicine, government, the sexaling sciences, and so forth, but even about the martial arts sciences, and ninja sciences, and the techniques they learned, which they practiced, many of them, diligently. They can do some very fancy martial arts and ninja assasin tricks, if you ask them to, and they can be very entertaining as some of them are very adept, or skilled at performing these tricks, and secret martial arts attack and destroy skills. As a rule, in the Lesbianists organization, any way, they are only allowed to use those skills, in a life or death situation, so you should treat them, well, and be courteous, considerate, and kind to them, and make sure their stay is comfortable, and that they are well fed, and offered only the best foods, and the best wines, etc. They will help you to learn how to make good tasting wines, which are not only good tasting, but also, good for you, which will help feed all the animals in your bodies, including the organ animals, so that you can

> regenerate and rejuvenate your bodies.
>
> Of course, when they were in training, for the out bound planetary expeditionary settlement program, when they trained in the martial arts, and when they trained in the ninja sciences, they were certified, and got their diplomas, as well. In the guidelines, they are not allowed to use their ninja attack and destroy skills, or their death threat level, response and offense to attack and destroy an enemy, who might like to dislodge them, forcefully from government, and perhaps kill them, if they could, to get them out of the way, permanently, unless their lives are in danger.
>
> So long as you do not threaten them, and make hostile remarks to them, and so long as you remain courteous, careing, considerate, and kind to them, and so long as the men and boys act in gentlemenly manners, and so long as the women and girls act with lady like, polite manners, to whom ever your guests are, you will certainly be able to get along with each other, without any problems, at all.
>
> They were trained in the sexaling sciences, and in the molding sciences, and in all the academic sciences, so that they could also offer educational programs to all of the new comers, whether tummy babies, and off spring, the children of the members of the out bound planetary expedtionary settlement program, or whether new members, incoming from else where, who would like the additional academic training.
>
> Try to get along as best as you can, and remember to be polite, and talk politely, and be courteous, and make every effort to allow them to enjoy the luxury of relaxing days and nights, fully sexaled, and fully fed, and allow them to make lots of aphrodesics molds, and other molds, as well as useful and tasty beverages, such as those they can make with fruits, and juices, and molds of various kinds, which will increase the amounts of nutrients in your body to help feed all the hungry animals, and organ animals, and cell animals, and amoebes animals, etc., who are all in your body, and who are all in need of nourishment.
>
> Remember too, to always test feed the drinks to farm animals, such as pigs, hogs, goats, lambs, sheep, dogs, cats, and so forth, including other animals, such as guinea pigs, mice, rats, ferrets, and wart hogs, first, if your guests will not drink the beverages they make, for some reason.
>
> We want every one to remain healthy, and happy, and there should be no toxic poisonings of the food and drink permitted, due to tricky knowledge of poisons the Lesbianists, or Zealots, and their radical friends, can make, with their knowledge of the molding sciences.
>
> Make sure every one remains on the best of terms, and make friends with them, after sexaling with them, for several weeks, or longer, and when they begin to truly enjoy their stay with you and your family members, and with you and your family's relatives, and with you and

> your family, and so forth, and your neighbors who will be dropping in,
> every day, hopefully, to enjoy extended sexaling sessions, for days,
> and weeks, and even months, and even years, in lots of cases, as they
> haven't had the chance to sexal very much, ever since they all came up
> from underground, where they were living, and sexaling with all their

> your new 'family' members, or guests, into your homes, as you sexal with each other, the longer you sexal with each other, sooner or later, you will begin to be able to love and trust each other.
>
> When you are able to love and trust each other, and when there are no residual hard feelings, or unpleasant memories left, when you all love to snuggle and sexal with each other, having lots of fun and laugher with each other, then you will want to begin to get the shopping lists of delicious foods for them to eat, and you will want to get the shopping lists for the items, that they will need, to make the delicious molded foods, and the delicious snacks, given their incredible know how on making delicious foods, and delicious snacks, and delicious beverages, based on all their academic learning, training, and teaching, that they acquired over the many long years of study, public service and volunteer work they performed, to qualify for the out bound expeditionary settlement programs.
>
> In time, you will all be able to regenerate your bodies, look younger, feel great, feel more fit, and your stamina for sexaling will have improved, if you follow their advice and tips on how to improve your sexaling methods, and your sexaling techniques. As you listen to them, and learn from them, you can level up your sexaling sciences knowledge, along with your sexaling skills. In time, you will also be able to learn all about the molding sciences, and you can even have them teach you some of their 'sneaky' tricks, that they know, that could kill you, if they were allowed to mold up, any thing they wished to mold up, without supervision.
>
> Remember, a loving relationship is not the only thing needed to build a trusting relationship. Understanding, respect, and careing for each other, all go a long way towards helping you to deepen your trust with one and each other, so that you can deepen your tenderness towards each other, and strengthen your bonds of love, for each other.
>
> Supervise carefully, every thing they do, and remember, if they will not eat or drink what they make for you, you should test feed it to the pets you have, as I've explained about, before, for several weeks, as there are fast ways to poison people, and there are slow ways to poison people.
>
> This is a very difficult area to manage, but once your guests, your new 'family' members, begin to show true love and affection, and unflattering love for you, and for your family members, and for your friends, etc., with respect for you, your family members, and for your friends, along with care, consideration, and understanding, these problems will become less of a threat to having a happy and mutually cooperative, and prosperous relationship with each other.
>
> Unflattering Love
>
> Unflattering love, is a type of love, where you accept each other, for who you are, with all your faults, and frailties, no matter what they are. It's like a brother and sister relationship with each other, with

In fact this is how a lot of early 'live chassis' 405 line TVs worked, except that they used a resistor in place of a light bulb.

Yuck!!

No voltage regulation at all, let alone the electric shock risk.

If you did connect a sulfated battery to this, the battery could easily drop 60V at normal charging current and it would get extremely hot, extremely fast. I would not like to be near something full of hot sulfuric acid and

```
hydrogen and probably also a source of ignition in due course.

A modified PC power supply would be just as cheap and far safer.

Yes, they had some at Lidl a couple of months ago that were VERY cheap and
had regulated charging voltage, and looked like pretty good chargers.

Thanks Pete,
Very interesting indeed; perhaps I can convince the local library to
stock one of your books.

Christian

I picked up a couple of inverter powered microwave ovens at the goodwill and I was wondering if these power suppies can be used wih tube amps and such. Also would like schematic data if I could so I could see if I can modify them for other voltages besides thosed they are designed.

Jimmie

I didn't know such contraptions existed ;) Please post brand name, model
and nameplate information from them to permit a bit of research. Sounds
like a candidate for the quad 807 linear awaiting a power supply...

Regards,

Michael

A friend gave me two 807's for my exciter project.  The first one I
tried turned into an 866 and just glowed blue and had a mini lightning
show inside.

The second one looks like it has a coating of soot on the inside or at
least a smoky glass sort of look.  It is so neat and evenly distributed
that it is possible that it was made that way on purpose.  I have never
seen another tube that looked like that and no one I have asked has either.

So, the question is:  could this be intentional or is it indicative of a
tube problem?

I can only seem to get about 10 watts out with about 30 input and wonder
if there could be some connection.

I just ordered a NOS from Antique Radio but thought I would ask anyway.

Pics of this project are at http://schmidling.com/radio.com

Thanks,

js

Hi,

I am trying to build a tube power oscillator running at 25MHz from a Russian tube (GI6B), and although I have it running, I can't seem to ramp up the power to anywhere near the level I want out of it. I am aiming for 200 to 400 watts, but I seem to be running at just a handful of watts. Everything I have tried that I assumed would control this parameter seems to have failed to work...

The RF is needed not to transmit but to drive a plasma, but for now I just want to get the tank coil running the right voltage level. But with a B+ of about 1000V, I am only getting about 50 volts in the tank coil.

Circuit diagram is available here http://geocities.com/peterpion/oscillator.jpg

Parameters are:
Voltage = 1000V, full wave rectified and smoothed
Tank coil, 5mm copper tube, 7 turns, 5cm diameter, 7cm long, 1.3uH
Tank Cap, air dielectric, 5mm spacing, 13cm square, 31pF, 1.6mm thick copper plates
Tank circuit is capable of taking at least 100A, very heavily soldered
Feedback coil, 5 turns 2mm copper wire, same diameter as tank coil, 5 cm length, placed on same former with gap of 3cm between tank and feedback coil.
B+ choke 120 turns on 32mm diameter former
Bias, external 12V supply, fed via a diode to the ground side of the grid coil, with a 33k resistor going to ground from the same point, bypassed by a 1nF cap.

Although I have it running, both increasing or decreasing the feedback turns reduces the tank voltage.

The tube spec is 350W anode dissipation, mu of 18-26, 2.5KV max, but with heavy grid current requirements it seems, although I am not quite clear on this.

http://www.nd2x.net/gi6b.html

Ive never built anything like this before, and I am lost as to where I am going wrong. Is it that the tube has too little gain to drive itself up to those power levels? I assumed that the low gain would just mean that I had to couple more power back to the grid to make it work. But if I increase the turns on the feedback winding, it actually reduces the power - as does reducing the turns. 5 seems to be optimum.

I have taken care to keep all leads short - very short (1 to 3 inches mostly). Rats nest construction. Have tried several types of caps, all apparently rated for heavy RF use. Even rolled my own caps from copper sheet and polyethelene which work the same as the other caps.

On the scope, I can see that I never drive the grid into positive. This seems wrong to me, but nothing I do makes it go positive. On the plate, all I see on the scope is a tiny 50v drop (at 25MHz) when the tube is supposedly hard on, ie the tube at the most on condition through the cycle, still has about 950V across it. So I assume that I am not turning the grid on enough.

I am wondering if the problem is gain, IE is there too little gain to make it work properly? Do I need to add another tube in a darlington type of arrangement to add enough gain to make it work better?

I want this type of free running oscillator because it should stay in tune as I add small amounts of reactive load (the plasma during warm up etc) - or at least thats what I believe, not being an RF guru I am not certain of this.

If anyone can help me I would appreciate it very much. Having spent the last 2 weeks trying, and read everything I can and searched the web extensivley, I am at a bit of a loss as to what to do next.

I do apologise for probably stupid mistakes / questions (you cant do that! you need a driver stage...? who knows!) but I am sure someone must have done this before so I appeal to them to share their experience!

Thanks, Pete

Those will work. The $11 one is a better deal, you can get your own

battery snap for pennies...
Thanks!

The first tube is obviously seriously gassy. Black coating were applied to some tubes but I don't remember seeing it on 807's, just some receiver tubes. It might also be a deposit of something from the filiment/heater. Do you have a tube tester? Many will test 807's. Low power output may be due to low filiment emmission the tester will tell you.

I think the fact that you do not have a load on the output tank, is what is limiting the >power< output. Power tubes require a particular load Z to deliver 'rated' power. Right now all I see is a parallel LC tank which will be high Z. You quote a voltage of 50V "in the tank coil". How are you measuring this?
Can you monitor plate current? If so, that times the applied plate voltage will give you your DC input power. Power out will >always< be less than this amount.
Also, are you sure your HV supply has the current capacity for the 200-400W you want to get out? (This may mean something like 300-600W, or more, DC input power).
Are you taking steps to prevent radiation of the generated RF into the wider environment? The level of power you are talking can reek havoc with other licensed users. The FCC could pay you a visit.
Finally, BE CAREFUL! These DC voltages can kill, and you have not lived until you have gotten an RF burn from 100W, much less 300-400W.

Hi Bob thanks for the attention,

Re the load, I am using a soft iron 'poker' which I bring close to / into the tank coil to provide a load which I can easily tell when power is delivered into. So I fire the circuit up with the scope connected to a certain point, then increase the load by bringing the poker closer to or into the coil. The iron looks like a very close to resistance load, the Z varies with the proximity. So I cat test all loads from high Z to a few ohms. If the iron gets hot, I am delivering a decent amount of power - got some decent power with a circuit like this running at 7 MHz with the iron getting very hot.

While doing this I monitor the voltage on the plate or tank coil with a scope. So the 50V is the best peak to peak voltage across the tank coil.

Loading the circuit more reduces the pp voltage in the tank. And since the tank Z is about 200R, p=e(squared)/r so p=1.6 watts in the tank circuit.

Plate current is around 100mA but this is mostly dumped into the anode as heat.

PSU is half amp MOT plus variac, bridge rectifier and 10uF cap. Shunts are removed from MOT. Plenty of power available, about 1kW.

As for shielding, when running at full power the whole thing will be screened including the load. Till then though, the tops off although I dont think that much will radiate from the exposed leads even when the power gets up to decent levels.

As for RF burns, yes I am rather nervous about that too... I am used to working around up to about 20kv but this RF angle is a new thing, so I am being cautious. Painful experience is the best way to learn your lesson and I have had it :-(

Anyway thanks for the suggestions.

Where are you getting the "200R" value from? (And what is 'R'?)
Another thought is to change the L/C ratio which should give a different
loaded Q with a given poker position. This may provide more power out.

200R is British for 200 ohms.

(which does seem a bit low for a proper match, for 1kv plate voltage and
~300w RF out shouldn't the tank Z be closer to 3,000 ohms?)

(or is my sleep deprivation showing?)

>
> Thanks, Pete
>

With only 1KV on the anode you are unlikely to get more than 40W out. You need to be nearer to 2.5KV with a lot of cooling to get anywhere near 400W. Good layout is vital with this tube, they are good to 3GHz and will take off without some sort of stopper in the anode cct.

```

Also... borrow a GHz Spectrum Analyser and chech that the unit is running at the expected freq. What bandwidth is your scope ?

An anode APC is also a very good idea. A few turn of 16AWG around a 2W 4R7 maybe a good start.

Any chance of cranking Va up to 1500V just to see how much power increases ?

Don't forget a fresh change of underwear and a fire extiguisher :)

Regards,

Mark

Well im not completley certain - heres some of my maths.

Far as I have read, for Class C operations,

Load Z should = Plate voltage/2 * Plate current

And since I am aiming for plate current of 300mA or so (for power of 300 watts at 1kV) then thats

1000/2*0.3 = about 1500 ohms (R).

Then tank Z should = load Z / Q

For a Q of 7.5, which is slightly below average I think, thats 1500/7.5 which is 200R tank Z.

Then via Xl = 2piFL, Xl is 2 * 3.14 * 25M * 1.3u which = 204R
and

via Xc = 1/2piFC, Xc is 1 / (2 * 3.14 * 25M * 30p) which = 212R

So the tuned circuit is going to buzz at a slightly higher F than 25MHz but only slightly, at a Z of about 208R. I think stray values are larger than the difference here so this is not worth worrying about.

Thats my understanding of the maths having studied it over the last few weeks and I am pretty sure its in the right ballpark, although the Z could be a bit high or a bit low for the tube conditions. But since the thing buzzes at 25MHz the F is right, and if the Z is a bit off this just means the Q is a bit off and I understand this is not a critical parameter for power.

Also to back this up, the tank Z and tank coil and tank cap values are about the same as you see in published designs for this tube (GI6B), this power level, and this frequency (eg http://www.nd2x.net/yu1aw/1xgi7-6m-schem.GIF
- its a GI7B but apparently they are almost identical). Ive compared with a few circuits for these tubes and they are all similar.

Only thing of course is that they all use grounded grid, which is not anything like the grounded cathode I am using.

Of course if I have my tank Z wrong, this would surely cause power problems. But as I say, I cant see anything wrong with these values, but maybe thats my lack of knowledge...

Thanks for the help so far...

Thats interesting - whats a stopper in the anode circuit? The
combination of a resistor and an inductor? And if the tube does take
off at 3GHz, will I get fried by the microwaves??!

Regarding good layout, what should I be watching out for? Is this just
a matter of short leads, or do things like the position of the tank
coil relative to the tube matter?

Re voltage, I have cranked this up to 2.2kV (its on a variac) with no
extra joy - the tube gets very hot very quick (of course) but the tank
circuit dosent get any more voltage across it.

GHZ spectrum analyser would be a nice bit of kit to borrow, but I dont know anyone with one - which is a pity. The scope is 40MHz so 25MHz is pretty close to its max and the resolution is not the best. Waveform is fairly symmetrical so I think the fundemental is right at 25MHz.

Ill do the APC tonight, what difference will it make?

As for 1.5kV - yup, I have had it cranked to full, 2.2kV, and no extra power really (maybe a slight amount, but I am looking for 1kv swing where I am only seeing 50v so its not even close). Underwear got messy... makes the hair on the back of my neck stand up from fear to be that close to a 10u cap charged to 2.2kv...!

The APC is intended to be resistive (damps Q) at high freq and very low reactance at operation freq. I should have mentioned that the 4R7 should be a carbon resistor (not wire wound).

I hope that the anode isolation inductor is mounted away, so can't form part of the tuned circuit... What value is the inductor you are using ?

Just for getting the anode tuning sorted out, have you considered driving the grid with a crystal oscillator source and a suitable buffer - this splits the problem in two. A few volts of drive should be a good start, maybe a CMOS oscillator driving some paralleled 74AC04 buffers, that will give you 5V P-P drive into a 1:2 torridal transformer, 10V P-P may be useful dive ?

Just out of interest, why haven't you gone for Grounded Grid configuration ?

-Mark

VHF oscillations will develop extremely high RF voltages since the
tank coil will look like a high impedance RFC and there will be
no load. Expect to see a lot of arcing.

I was kinda wondering if maybe there wasn't some humongous GHz
oscillation that's taking up all the power, leaving none for HF. As you
point out the best way to check this would be with a spectrum analyzer,
although without it you could maybe slowly increase the plate voltage
and look for odd jumps in grid current or dives in plate current.

I looked at the data sheet and saw two grids -- is this a 'normal'
tetrode? It appeared that they were calling out negative voltages on
grid 2, which confuses me.

<snip>

> During the last field day some members of our club ask if it is possible to connect to the main station two headsets and a speaker at the same time. Each headset should have his own control of volume. The volume of the speaker will be control by the vol of the radio.

Pads are commonly used to control volume at the jack in audio distribution arrangements; I also use headphones which contain a built-in pad for volume (a slider mounted in one of the earpieces). In the U.S., Radio Shack used to be a source however I cannot find any at their website.

Use a pad that maintains a nearly constant input impedance to audio across its adjustment range; the bridged-T pad has both constant input and output impedance. Make sure the total parallel impedance of the connected pads matches your audio distribution impedance, (say 600 ohms); use a transformer to match the audio output impedance of your radios' speaker jack (say 8 ohms).

Consider controlling the radio's speaker with a pad as well so that the line level remains unaffected by local volume settings.

A site describing pad construction and theory is at:

http://www.uneeda-audio.com/pads/

I have built a homebrew MFJ-1020A (tunable active antenna) which works reasonable well, but am not satisfied. I am wanting to incorporate a Q multiplier in it for the purpose of narrowing bandwidth of the received signal, as well as increasing sensitivity so I can pick up weak stations better (like Voice of Korea, which for me is right on the edge of intelligability). The circuit I am working with uses an Armstrong Oscillator set to *almost* begin oscillation, with its inductor being a loop in parrallel with the loop antenna I have hooked up to the 1020A, as well another coil of wire which feeds the preamplifier in the 1020A. My loop antenna has four turns of about eight inches diameter, and I have enough wire for the preamp pickup to have 25 or 26 coils, but am not sure how to construct the single coil used for the Armstrong Oscillator. Should I have a single coil parrallel with all the rest (both tuner and preamp pickup) or should I wrap wire around the other two sets of coils, toroid-style, and make that the coil for the Armstrong Oscillator? And should I use very thick wire (like 10 guage multi-strand) or something thinner (like 24 guage single strand)?

I really have no idea which approach would be more effective for the Armstrong Oscillator, and would be grateful for any input the group has. Just for the record, the Q-multiplier I am trying to incorporate is taken from Joe Carr's Practical Antenna Handbook, and is also in his book called Antenna Toolkit.

Again, any help would be appreciated. I really am (obviously) an RF newbie.

Many thanks.

Dave

Anybody remember back in the "old days" using a super-regen receiver?
Centering the signal in the passband gave AM, tuning off to the side one
could slope-detect for FM and if the regen control was set high enough to
make the detector break into oscillation, (in essence, inserting a BFO) one
could then detect CW/SB signals.

Just reminiscing,

-NM

I'm trying to get an idea of some of the tradeoffs involved in determining where to perform the analog to digital conversion for a SDR design which uses 200 MHz as the first IF (pick due to SAW filter availability and it's high enough to simplify the front end filter bank ... the receiver is a homebrew type intended to cover .5 - 600 MHz with a maximum signal bandwidth of 200 kHz).

Some options:

1) Sample at the first IF using subsampling.

   Advantages: Eliminates the need for an additional LO and mixer.

   Disadvatages: Brad Evans points out in a comp.dsp article entitled "Undersampling (was: RF/IF digital receiver)" that using a high IF means that it will be more sensitive jitter in the ADC clock.

   The LTC2203 does 25 Msps with a 16 bit output and has a front end which can handle 380 MHz.

   The AD7763 does 40 Msps with a 24 bit output and includes a digital FIR. However, it's not clear to me what's the maximum frequency that it can handle. What's very interesting is that Analog Devices has an evaluation kit (EVAL-AD7763) available from Digikey for only 163 dollars and it includes (according to the literature) a BF537 EZ-KIT Lite. This appears to be a very inexpensive way to experiment with SDR.

2) Convert the first IF to a second IF of 21.4 MHz and then subsample.

   Advantages: Less sensitive to ADC clock jitter. Many different crystal filter are available for 21.4 MHz from places such as Network Sciences. This allows additional filtering to be done in the analog domain which should increase sensitivity.

   Disadvantages: Involves an additional LO and mixer which means more noise. ADSimPLL says the LO noise is -114 at 10 kHz. Mixer spurs at 7x8 and 8x9. I'm assuming that the spurs are not that interesting given I'm using a LT5512 which is a double balance mixer (i.e. even harmonics don't occur).

I imagine that the AD7763 will handle subsampling 21.4 MHz.

3) Convert the second IF to a third IF of 2.9 MHz and sample using a AD9874.

Advantages: The AD9874 also contains AGC and an I/Q demodulator in addition to a LO PLL and mixer. This means that the DSP doesn't have to handle these chores.

Disadvantages: Involves an additional LO and mixer which means more noise. ADSimPLL says the LO noise is -119 at 10 kHz. Mixer spurs at 6x7, 7x8, and 8x9. I'm assuming that the spurs are not that interesting given the AD9874 mixer is a double balance type (i.e. even harmonics don't occur).

BTW: I'm willing to sacrifice some performance if it means making the hardware easier to build (i.e. allows for more slop in the PC layout and assembly).

What are peoples thoughts, opinions, and experiences regarding these types of tradeoffs?

I just built a new ham radio website that has ebay listings of ham
equipment, the latest ham radio news from all over the world, some
articles about the big three and more.
Come and visit and use the contact page to contact me and tell me what
you think, suggestions or comments would be appreciated.
http://www.amateurradios.info

Thanks,
Bill

Sounds to me like the IF plan is a little screwy already, since the
200MHz IF is in the tuning band of 0.5 to 600MHz.   Not sure how well
that's gonna work for ya.

A 200MHz IF is a little agressive, but it's workable if your ADC has a
SHA with good enough aperture time and you have a clean enough clock.

Personally, I'd pick a different first IF that solves the tuning and
the sampling problem, but it may be tricky with such a wide tuning
band.

>I have built a homebrew MFJ-1020A (tunable active antenna) which works reasonable well, but am not satisfied. I am wanting to incorporate a Q multiplier in it for the purpose of narrowing bandwidth of the received signal, as well as increasing sensitivity so I can pick up weak stations better (like Voice of Korea, which for me is right on the edge of intelligability). The circuit I am working with uses an Armstrong Oscillator set to *almost* begin oscillation, with its inductor being a loop in parrallel with the loop antenna I have hooked up to the 1020A, as well another coil of wire which feeds the preamplifier in the 1020A. My loop antenna has four turns of about eight inches diameter, and I have enough wire for the preamp pickup to have 25 or 26 coils, but am not sure how to construct the single coil used for the Armstrong Oscillator. Should I have a single coil parrallel with all the rest (both tuner and preamp pickup) or should I wrap wire around the other two sets of coils, toroid-style, and make that the coil for the Armstrong Oscillator? And should I use very thick wire (like 10 guage multi-strand) or something thinner (like 24 guage single strand)?
>
> I really have no idea which approach would be more effective for the Armstrong Oscillator, and would be grateful for any input the group has. Update: I tried the 26 turns of #10 wire for the input to the preamp, and a tuning loop of four turns of coax with the shield and center conductor connected, as per Joe Carr's shielded loop example, and the whole thing held together by winding #24 wire around the loop toroid style, with that as the Armstrong feedback loop. Waste of time. Couldn't tune the antenna to pick up anything. Put it on the test bench and determined that two turns of shielded coax was needed, in a smaller diameter loop. Then used one turn of #10 wire for the feedback loop and another for the pickup for the input to the preamp. It does work, but nothing like I expected or was hoping for. I can tune the antenna to 10 MHz with my 10-400 pF tuning cap, but nothing very far to either side of that. And the Armstrong oscillator does it's job, but just barely. Am thinking I need more amplification for the Q-multiplier circuit. Currently using an NTE-451, with a gain of something like 100 or 120 if I remember correctly, and am going to try an NTE-199, with a gain of 400. May even put two of those in, in a Darlington configuration. I don't know. Making it up as I go along.

Also realized that I no longer actually have an MFJ-1020A, as I have replaced the tuning circuit from that schematic with a variable capacitor to tune the antenna and the Armstrong oscillator. The only thing left from the 1020A is the amplification portion of that circuit. Now trying to tune everything by tuning the antenna.

Would really appreciate any input anyone has, but will understand if all of this is too vague. Hope no one minds my posting. It helps me think of what I want to try next.

Thanks for reading. Sorry if I'm just wasting bandwidth.

Dave

Forgot to mention, I am using a 1K linear taper switched potentiometer to control the feedback in the Armstrong oscillator. Suspect I need a 10K pot. As soon as I switch it on, it peaks out, and then drops off as I turn it up. On the other hand, it does work, even if not to the level I had hoped for. Wanted to include this for those who wondered about the construction of the whole antenna/feedback loop/input to the preamp loop package and how feedback was controlled.

Again, sorry if I am just wasting bandwidth. Appreciate your patience.

Dave

Okay ... I need to pay attention to spurs from the first IF mixer when working out a frequency plan.

For the sake of the original question let's assume that the RF range has been changed to one which is appropriate for a 200 MHz IF.
The question still being regarding the tradeoffs of where to digitize the signal.

Followup question being ... any good guidelines for picking the first IF frequency other than:

1) High enough to simplify the input filters.

2) Something that is easy to build / buy a good filter for use after the mixer.

3) Something that results in a minimum amount of spurs from the mixer.

4) Something that isn't so high as to complicate construction more than
      necessary.

Hi John,

The BF537 EZ-KIT Lite + AD7763 for less than US$180 looks like a brilliant deal to me, but won't you need I as well as Q channel ADCs ?

I am not sure how much enthusiasm I can muster for a BF537 when only packaging available is 192 or 208 BGA, it sounds like a project that is always destined to be a prototype board. It does look like a very capable DSP however.

If you want to experiment with SDR, does it get any simpler than SoftRock 40 ? I guess I have a natural inclination to use a platform where there is an established user base - hence plenty of help and support.

My other inclination is also to try and keep the sample rate as low as possible, so there are plenty of un-optimized-code CPU cycles available to allow swift algorithm development rather than scrambling around for every last CPU cycle at the start of a project.

Having said that all out loud, my inclination is to go for a decent
DDS LO, for front end agility, sampling down to a high sample rate
(192kHz) stereo (I + Q) audio ADC and to take it from there in DSP.

With that all under my belt, then time to look at higher performance
solutions, once the question is better understood.

Regards,

Mark

This spammer, Charles M. Nudo, Jr., of Drums, PA, says rules don't apply to him and spams Usenet unrepentantly for his own eBay and Audiogon trash and for businesses he cons into paying him to spam their wares. Since having all his Google Groups sock puppet accounts shut down for spamming, he's started another one using his own "rinky-dink" Yahoo domain, 8trackaudio.com.   All his spam posts originate from frontier.net (formerly epix.net,) his home ISP, and since he's dumb enough to use Google Groups, his IP is in each header.

Such eBay auction spam is a violation of both Google Groups' and Frontier.net's Terms of Service. Per his ISP's Terms of Use, it's also a violation to violate the rules of other sites, and the spammer can be assessed a minimum $200 fine for such a violation. See applicable rule statements at:

http://www.frontieronline.com/residential_aup

and...

http://groups.google.com/googlegroups/terms_of_service3.html

Fight back against Usenet spam by sending his spam message, with headers, to:

groups-abuse@google.com

abuse@frontiernet.net
abuse@audiogon.com

You can also reach Frontier's abuse desk on:

866-474-7662

Be sure to include his IP in your complaint to Frontier, which is
209.74.29.60 for this spam load.

I think you may be overdoing your concern on the sampling clock. The jitter that matters is the amount of time jitter on the clock. If you can generate a tone that's pure enough to down-convert the 1st IF, then you can generate a clock that's pure enough to down-sample. In either case, if you're crystal controlled you'll probably be much more stable than the LO with which you're doing your first conversion.

At this point you need to ask not can you _generate_ a time base that's low enough jitter to do good sampling, but can you _preserve_ the clean signal through your entire sampling path, starting with whatever logic generates the clock, all the way through to the actual sampling. If the sampling takes place inside the ADC then you need to hope (or verify from the data sheet) that the ADC isn't introducing much jitter. If you're really concerned about this then you could make your own sampler with appropriate components to insure the jitter is within your control.

Each frequency conversion inevitably reduces the IP3 and the KP of the receiver. The other problem with the multiple conversions is the feedthrough of the harmonics and intermods of the heterodynes to the input of the receiver; this creates the "deaf" points in the frequency range. So, the intention is avoiding multiple conversions unless it is really necessary.

The multiple conversion could be necessary if the high attenuation of the adjacent channel is required and if the desired channel bandwidth is too narrow. It is difficult to make a good narrowband filter for the high IF.

The clock jitter can be taken care off. The suppression of the aliases is determined by the 1st IF filter. You will need a good filter, especially if subsampling.

[...]

It depends.

What are the final parameters of the receiver that you are planning to achieve?

What benefits do you expect from doing the processing in the software?

How much of time and money do you have?

The intent would be to implement a digital downconverter in the DSP.
That of course begs the question of how much horsepower is necessary
to implement a DDC? I know people are doing it using FPGA, however
I haven't seen anyone doing it using a DSP.

Another option would be to insert a AD6620 which is a digital down
converter.

Defined as the best as I can implement without having a mental
breakdown,
going broke, getting into trouble with the wife, or taking forever.

I realize that in the real world the requirements should be a little
more
concrete.

> What benefits do you expect from doing the processing in the software?

Flexibility and learning.

> How much of time and money do you have?

A lot of time ... one advantage of this being a hobby project is no
deadline.

Money is flexible, not unlimited (I do have to answer to the wife),
say
$ 1000 US dollars (more if spread over a longer period of time :-).

I was considering a Hittite HMC580ST89 InGaP HBT Gain Block
which has a NF of 2.8, covers DC - 1 GHz, and is easy to use
(i.e. can operate directly from +5V).

> The mixer will produce spurs from several causes..
> Dirty LO source, for that range I assume you using a carefully

Currently the design calls for using a AD9952 DDS followed by
a 10.7 MHz BW=300 kHz crystal filter to provide the reference
for a ADF4002 PLL controlling a UMC VCO. ADIsimPLL claims
phase noise of -107 at 10 kHz.

If the sample rate is low enough there's no reason the DDC can't be
done in software. Since your signal is narrow that might be possible
if you can sort out the IF issues and the IF filter bw.

A SAW filter.

> >Currently the design calls for using a AD9952 DDS followed by

The 300kHz filter is for the DDS output which is the reference for
the PLL so that I can vary the reference frequency enough to generate
a precise LO. It is not the filter for the IF.

I've heard that high side mixing is preferred to low side
mixing because the LO harmonics will be higher and less

likely to cause problems.

It also seems to me that (f1 + f2) is typically discarded and what's used is just the (f1 - f2).

Any truth to either of these impressions? If so, what's the rational?

Depending on the availability of off the shelf VCO parts one might what to use (f1 + f2) or low side mixing and I was just curious what (if any) additional problems I should look out for.

On Jul 2, 9:27 pm, j...@feith.com wrote:
> A SAW filter.

Sorry I misspoke ... the SAW filter is between the LT5512 mixer and
the HMC580ST89 being used as the IF gain block.

I'm looking to use a selectable LC filter bank between the antenna
and the HMC580ST89 being used as the RF gain block.

> That makes more sense. The selectable LC filters octave or fraction
> of an octave?

I was looking at fraction of an octave, however I have yet to decide anything more specific. Actually I started by playing with Ansoft Designer to design the filters, keep being unhappy how they turned out, and as a result keep having to increase the first IF to make it easier to have good image rejection. I had naively started with 10.7 MHz as the first IF ... I may not have a lot accomplished, however I'm certainly learning a thing or two. :-)

> Generally it's antenna, a low loss selectivity, RFamp, Image stripping filter then mixer.

What's the downside of doing the selectivity and image stripping as one filter prior to the RFamp?

> I consider a RF amp at VHF/UHF of more than 1.5DB NF to be noisy.
> This is because current technology for low noise amps are well under 1 DB to the 500mhz region maybe higher.

Care to mention a couple of model numbers?

It's easier to dodge harmonics and higher-order mixing products.

For _any_ IF/LO combination you should make a table of the possible
mixing products of the first few harmonics of your RF range with
several harmonics of your LO range (most modern mixers generate _lots_
of odd harmonics of the LO internally). If any of these products other
than the intended pair span the IF then you'll have problems with
spurious mixing.

Mmmmmhmmmmm ... and this really is important for all us radio-builders
to know, I suppose. But _why_?

Hey Brian, if I use your pre-production-stage-for-almost-a-year-now
processor to ask why you refuse to post your now defunct non-linear
linear, like I've been doing for over a year, would you be able to
hear me THEN?

WOW, that was FAST!!! Is that all you do? Sit there in your parent's basement waiting for someone to order one of your hack-jobs when you can't even give an estimate on when they will go into full production? Don't you have anything better to do? I mean, heck...... look at posts from yesterday afternoon, one of the biggest national holidays, when just about everybody can find something to do besides jerking off in front of a computer. It seems that the only people who posted were you and the trolls. And yet, even with all that spare time because you couldn't drag your ass away from the computer and out of the basement long enough to join the rest of humanity in a barbecue, you AGAIN refused to answer the tough question, just like you have done for several years now.....

Where's the schematic for your hacked amp, Brian?

Hi.

I often search for people's web-published homebrew receiver, transmitter, or transceiver projects.

Can I please encourage those that design these radios to try to conform to a standard when choosing the title name of your webpages. That would make it better when searching for radio projects.

I was thinking that a convention could be something like the examples below:

"DX Chaser 5" AM Multiband Receiver

"Super-smashing-great-all-singing-and-dancing DX sniffer" 20m Monoband SSB receiver

"The better than Pixie" 30m CW Monoband Transciever

"Goblin 80/40" 80/40m CW/SSB Dual Band Tranceiver

"Babe Radio 77" 10m FM Monoband Transmitter

The thing is to try to name the page so that folks can put a search string together i.e:

"CW Monoband Transceiver"

"SSB Monoband Transceiver"

"AM Multiband"

"80/40 CW/SSB" Transceiver

Etc etc.

Although I think maybe if one searches the name of the title page only, there might not any advantage in using a search phrase.

It might even be good to put "homebrew" in the title as well.

Well, I think it's a good idea. :c)

I do find that I want to identify receivers only, transmitters only, and transceivers only, and whether monoband (and what band) or multiband, and what mode(s).

Perhaps someone can come up with a better naming convention.

Thanks.

Oh dear, are you selling oscilloscopes and test sets in order for buyers to
set their radios correctly?
You really don't have any technical knowledge. All you seem to do is
re-sell boards made by other companies.
You should see what people are saying about you in other groups, you have a
terrible reputation.

Hmmm... what company am I buying boards from?
Maybe I can stop designing... and just get the boards from them... lol
Thanks for your comments... they were quite amusing.

I'm afraid your idea won't catch on, as it seems to make sense(at least
to me!).
My wife (also a ham) complained about the time_sink of surfing the web,
looking
for that unread receiver article.But she decided it was cheaper to read
about
radios and such on the web, rather than actually buying them and bringing
them
home.
Along with your naming convention, I'd hope that everyone would make
PDF's
of all such articles.
Any websites you would recommend for the high_perf receiver fan????

Gregg,
There is no excuse for how many out here conduct themselves... but
there are reasons.
The main reason is that they have nothing of merit to add to any
conversation here, but desperately need to be recognized.
Thanks for your comment.

Why don't you ask Twistedhed about that one. I fought him for years on
a political issue only to find out that I was wrong. I still disagree
with his freebanding, but when I'm proven wrong, at least -he- knows
that I'll stand up and take my punches.

I'm giving you a chance to prove me wrong, Brian. If you product works
like you say it does, and it doesn't cost you any money, why in the
world -wouldn't- you be willing to sell me one?

>P.S. How's your master's degree from the College of Culinary Arts
>coming? Did you ever perfect your french pronounciation of "Do you
>want fries with that"?

No, but last March I did finish a study on EM wave interference
pattern and polarization interactions in atmospheric media of varying
ionization. It was a joint project with the meteorology department in
the study of weather radar, with extended applications to satellite

communications. Got any opinions on the subject, Brian?

Oh, and where's that schematic for your non-linear linear?

Absolutely right. These are discussion groups, but some people would rather use them as their own personal media for spamming products that would otherwise be pulled from the market for patent violations and/or

false advertising. It's truly shameful how these basement-dwellers
act, isn't it, Brian?

Hi.

Yes, and I think maybe there are free services or programs that will convert WORD files to PDF.

I don't know much really, but I just found this nice site:

he has offened them in the past the disciroptive word is "vendetta"
but of course it means he reqruitus them in to helping him spread the
word of his product

"one useless man is disgrace 2 become a law firm 3 or more become a congress" adams

woger you are a Congress all in your own head

You'd think he would have suckered someone by now. If not then why
would he keep spamming the groups?

"LOL!"

Die hard with a spam vengeance! (bruce willis is resurrected/bald too)

Brian is only about twenty years late with his CB noise toys, he might have
sold a gaggle of them in the 70's if he wasn't so busy with his paper route
at the time.

My math was a bit fucked up, but it's relative with 11 meters opening up
again. Fun band with fun people, if'n you have a good radio and antenna. (a
must)

Good Day All!

Have recently aquired a "homebrew" receiver which I am trying to upgrade
and fully restore to working order.
In the back of my mind I am quite sure that it was a published design

possibly in "Electronics Australia" or similar back in the 1960's or
early 70's.
It is a 6 valve/tube design using an ECF82 first mixer/oscillator (1st
if about 4 Mhz)
, a 6BE6 Pentagrid second mixer/osc, originally with varactor fine
tuning down to 455 KHz. 2nd oscillator on about 4.5 Mhz.
It then has 2 stages of 455 KHz IF originally using EF183's with 2 IF
transformers per stage, a total of 10 tuned circuits at 455 Khz.
This is followed by a 6BE6 product detector/BFO (Drake style) or a diode
for AM rception and an ECL82 for audio stage and output.
It has 4 bands from about 3 MHz to 30 MHz.
Does any one remember coming across this circuit?
It has some rather eccentric features like IF neutalisation and a VERY
lossy coupling between IF stages.
Any information gratefully received as I would like to
1. find an original circuit.
and
2. Find out why some of the peculiar design details were used.
Hope it rings a bell with someone.

73's Cliff Wright ZL1BDA ex G3NIA

You designers (bless 'em) that advantage us with your design skills and
projects : Can I please encourage you to always (within reason) name your
creations. I think that would be beneficial for web searching for other
people's comments, or searching for how they implemented your designs.

Take for instance the following actual descriptions:

"The AP-80 An Alternative Pixie"

(Fine, the rig is called "AP-80")

"Low Cost AM SWBC Radio"

(Problem. No rig name)

"(Fairly) Simple 75M SSB rig with PTT"

(Problem. No rig name)

"SSB Receiver / Exciter and Linear amp"

(Problem. No name for the exciter, or RX)

Allocation of a name or number to whatever you design would help. IMHO. It seems a pity that we have a great resource in the web in search engines, but their usefulness is limited by failing to properly name.

Let's say that I went and built the AP-80, but modified it a bit (or even if not), and published my implemetation of the AP-80. I'd name my creation/implementation something like "AP-80 (G3AAD)" (BTW, I'm not G3AAD.):c)

```

I wonder if we who are the Usenet-frequenting Radio Hams might somehow get together to sort out the dreadful mess that has been created in no small part by the self-interest of those who control the RSCB?

Might we all act together to produce a series of soggy "biscuits" that could then be assembled Lego-like fashion to produce any rig or test equipment? This would have a number of benefits, not the least of which would be the bankrupting of the cancerous emporia whose off-the-shelf Cheque-Book (CB) radios are not only discouraging the homebrew engineering that is the essence of _REAL_ Ham Radio but also encouraging an altogether undesirable element to regard themselves as of our ranks. Once the advertising income from those dead emporia ceased to flow, then the national societies might get back to supporting technical excellence instead of Complete Bullshit (CB) as they do now?

(And, no, I'm not thinking in terms of the facile hardware exercises that bring on the disease known as the gangrenous degeneration that is the M3/CB Fools' Licence scheme; facile because once a so-called "licence" has been granted the hardware diversion is largely forgotten.)

Anybody interested in mutual development of some soggy biscuits is invited to reply to the author via these fora.

> wire intended for use as "fishing cable".

Cable TV uses a multi-core cable with aluminum shield. If suspended above ground between houses then there is also a steel wire around it, at least in my area. The steel makes a good antenna, and a thumb-tack makes a good contact with the aluminum shield.

Fence-wire in our neighborhood makes a good 160-meter antenna, and it is already erected ;-)

Try loading your 80-metre TX into the telephone cable, providing it does not lead underground.

In Northern climates they have 2 parallel 20-metre long metal rod,s like a ships handrail, to stop snow sliding off the roof and burying passers-by. Go inside the roof space and connect to it.

There are loads of ready-made antennas without having to buy anything at all. Just use some of them when the neighbours are asleep (in this area that is during the day).

OK......what planet have you been on for the last 40 years? - check
out a thing called the "integrated circuit" or "IC" for short.

These are wonderful devices, they come as little plastic blocks with
pins sticking out of them. You connect signal in/out, voltage, a few
extra components to set parameters, and there you have a functioning
electronic circuit....

Please, stop ranting about the decline of AR and start reading a few

contemporary textbooks, or browsing manufacturers sites (they actually
WANT you to use the things, so publish lots of free information and
"application notes"...) or search the internet...

Stop complaining so much about the demise of the "good old days" and
start moving into 2007........

Andrew VK3BFA.

I'd been thinking for some time about doing a little experimenting that involved putting together a few functional blocks which were a little more involved than ICs, things like IF gain blocks and detectors and the like. Much faster to A/B test circuits that way.

Can anyone help on a manual or schematic for a Kepco SM36-15M supply? Kepco wants $ 100 for a manual... ouch! Google doesn't want to be helpful in this search.

Are you suggesting to load the transmitter RF output into the shield of the

existing live CATV drop cable? You'll wreak havoc with the network and
you'll destroy any trust that exists between the local ham community and the
Cable company. This is a horrible suggestion! Same goes for loading up the
phone line with RF

Ignore this one guys - be responsible!

With this suggestion solving the aerial problem then you need a good
ground to go with it. Maybe you could tie one end of a spool of wire
to a wad of paper and flush that down the toilet. When the spool
unwinds to the end you just connect that to the ground lug on your ham
rig and you have a long counterpoise wire installed underground. It
is even inside a protective conduit. What more could you ask for?
LOL

I started a new yahoo group. The purpose of the group is to facilitate the exchange of information. This includes informant ion on the restoration, modification, operation and the building replicas of the radios used by all countries involved in WWII. Items for sale or auction will be limited to military radios and parts.

You can join by going to this link

http://groups.yahoo.com/group/WWIIRadio/

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space

Hello,

Assuming I could made a nice rochelle salt crystal like the one shown here: http://seawhy.com/xlrs.html, any suggestions on how to proceed to make a piezo earpiece?

Some possible thoughts:
a. Spring clamp copper plates to 2 opposing surfaces and test with a multimeter for piezo effect, then super glue a malleus to the top plate and touch it to a foil drum. The plates are the electrodes.
b. Make a foil 'setting' for a small crystal, and touch the crystal to a foil drum. The 'setting' and the drum are the electrodes.
c. Load several small crystals into a shallow can and insert a copper plate with malleus [which touches a foil drum. The can and plate are the electrodes.

Joseph

Hello Folks,

The PCR1500 is around $500, and $100 more if you want the remote head.
It's tough to get much info on that remote head. Heck, it's not even in
the manual, at least not the large pdf version on the Icom site. Is it
worth to have?

I am not too familiar with ham stores in the US yet, wish the ad section
of QST was on the web somewhere. Anyhow, one that seem to be large is
AES. Other suggestions?

Joerg -
  Not sure what this is doing on the homebrew group.

  I did briefly get to try an associate's PCR1500 at his house. He did not have the remote head but was controlling it from a laptop.

  I was very unimpressed with the way that local BCB and FM stations had images showing up and down and all around the SW and ham bands. Somehow I had expected some preselection.

  I believe that with an outboard preselector or even just some traps to filter out the local stations before they hit the radio, I would've been much better impressed. The PCR1500 wasn't much worse than a typical $100-$150 SW receiver in terms of image susceptability (our neighborhood I think is particularly bad for the US, but I understand it to be nowhere near as bad as many major European cities).

  I also have a RX-320 (Ten-Tec's computer controlled receiver) and while it is not completely immune to BCB interference and images it is a much more minor problem there. It's also true that the RX-320 is truly aimed at the SW market.

  The PCR1500 had a bazillion nifty computer-controlled features that my friend was showing me (esp scanning VHF and UHF channels). He was more of a scanner nut than a SW or ham listener, and he seemed positively delighted with the radio and all it's features and computer controls and scanning channels and ability to monitor multiple channels at once. He had some special computer software that decoded and monitored at least a couple of the local trunking systems.

  Like when I'm using my RX-320, I missed having real knobs. I'm guessing that the remote head actually provides some knobs (but have not seen it either!)

Tim.

Yes. This is (usually) IC's on a PCB with the extra bits needed to get it to work. As long as you have the same impedance for each module, no worries. And the approach has merit - lacking sophisticated measuring equipment, its good to have a "reference" IF, RF, whatever module for A-B comparisons.

I think EMRFD covers this concept quite well....

There has NEVER been a better time to homebrew. We are not relying on war surplus from a global conflict anymore, and its pretty well dried up anyway. So many fascinating chipsets out there, a casual reading of any of the last 10 years of ARRL handbooks reveals this "systems engineering" approach - treat them like LEGGO blocks....

There is SO MUCH sophisticated good quality test equipment out there now - most industries are downsizing (gee, I love that phrase) - its cheaper to send a defective module off for repair (the spare automatically switches in on a fault condition) to the manufacturer than maintain highly skilled staff and expensive test gear. So, the test gear is being sold at RIDICULOUS prices. I recently bought a Chinese 500Mhz spectrum analyser for $500 - yeh, sure, not as good as a HP, (refuse to call them AGILENT) but then my 30 year old HP141 etc was badly showing its age and was out of calibration anyway.....

A good example - the AD9851 DDS chip . Wade through the pages of waffle, and it comes down to half the pins grounded, some more tied high, data in from a PC port on 3 lines, bias set by 1 resistor, a TTL clock module (prebuilt anyway) and a simple LPF on the ouput - voila, a 0-30Mhz sig gen/sweep gen/VFO with 1Hz increments, and crystal stability and accuracy. Doesn't need a complex PCB, can easily be paddyboarded/Manhattan style....

Go for it - don't be scared. The "good old days" were only in your head anyway, and it took the death of millions to provide us with that lovely war surplus precision mechanical engineering....what a terrible price to pay for a nice VFO capacitor and drive....

Times change - the Foundation license has transformed AR - yes, some idiots, but not nearly as many as the old timers noisily bemoaning their lost (and rose coloured) past.......all the dinosaurs will eventually die, do you want to be one? And getting an amateur ticket 30 years ago - how relevant is that now? - good to wallow in antique technology, but how about moving forward.

My club - its been bloody fantastic. The new F calls, on the committee, bring new skills and enthusiasm. They can organise a dinner out - the old timers cannot. They organise technical lectures - the old timers, with their "I did that 40 years ago" attitude don't. A long overdue breath of fresh air - should have happened 30 years ago, and would have except for the moaning and bitching of the "true" amateurs.

So saying that, I have been licensed for 36 years. I started homebrewing with valves I scavenged off the rubbish tip, as a kid of 12 I didn't have any money. First soldering iron was second hand, bought from the local radio club - in retrospect, sold at a fraction of its value to help a newcomer. Was mentored by WONDERFUL, true amateurs - generous with their time and knowledge. Are you? Carefully selecting the least leaky capacitors, measuring and marking old out of tolerance resistors to build something,anything, to explore radio. Even scavenging hookup wire from old washing machines and refrigerators on the tip.

Nowadays, still have a good collection of WW2 vintage gear for restoration - most of it semi vandalized by idiots doing "modifications" - I like it, nice BIG components, easy to see and work on. The classic 70's radios with tube back ends - easy to work on, parts more readily available than modern consumer stuff on the shelves currently.

But I also battle with SMD stuff - why, because that too is interesting - 1 chip does the work of a rackfull of valve gear. Its STILL the "magic of radio" - and I think a lot of us have got old and tired and grumpy and forgotten WHY we got into AR in the first place,

Go for it - NOTHING beats the thrill of learning, exploring,experimenting, and finally getting on the air and saying

"The rig here is homebrew OM"...

73 de Andrew VK3BFA.

Hi All,

Finally, as of today July 12th, Italian Amateur Radio operators will be roaming around the 70 MHz band, although for a limited experimental period and limited frequencies spots. Please see below notice

73

Gian

Italian amateur radio 70-MHz experimental campaign

- BREAKING NEWS -

Upon request of Luca Ferrara IK0YYY, the Italian Ministry of Communications, in coordination with the Ministry of Defense, is willing to kindly authorize an amateur radio experimental campaign on the 70-MHz band (4 meters) up to December 31, 2007. Activities will however only be possible after the authorization has actually been signed. Such campaign is being carried out under the technical coordination of Piero Tognolatti I0KPT, Full Professor of the Electromagnetic Fields Group and Director of the Electrical Engineering and Information Theory Department of the University of l=E2=80=99Aquila.

The technical parameters are:

=E2=80=A2 Modes: all (SSB, CW, AM, FM, RTTY, digital modes, etc.)
=E2=80=A2 Frequencies:
- 70.100 MHz =EF=82=B1 12.5 kHz
- 70.200 MHz =EF=82=B1 12.5 kHz
- 70.300 MHz =EF=82=B1 12.5 kHz

=E2=80=A2 Maximum RF power: 25W EIRP
=E2=80=A2 Operational area: the whole Italian territory except for a 30 km strip from the Austria, France and Switzerland borders
=E2=80=A2 Antenna types: omnidirectional and directional

The experimental campaign, whose results will be published after its conclusion, is open to all Italian radioamateurs.

A beacon transmitting on frequency 70.088 MHz (mark) with FSK modulation (500-Hz upward shift) is shortly going to be installed. This is at the very low edge of the authorized band.

We wish to express our warm thanks to the Italian Ministry of Communications (Ing. F. Troisi and Dr. A. Cascio) and to the Italian Ministry of Defense, who, despite the administrative and operational hurdles, have once more given the Italian radioamateurs a clear sign of esteem and credibility. Sincere thanks are also given to the Universit=C3=A0 of L'Aquila (Prof. P. Tognolatti) for its exquisite and effective cooperation.

Luca Ferrara IK0YYY =E2=80=93 Antonio Vernucci I0JX

Well, it's the only one I am subscribed to but I'll look for a more appropriate one. Also, I figured that folks who still build their own stuff (I do) would naturally gain more insight about commercial hardware than "plug-and-play" users. Because they can pinpoint effects to circuitry deficiencies just like you did below.

A fat mixer or even some LC filtering probably wasn't in the cards at that price level. But I could live with it because I mainly want to use it for EMI hunting. Being able to listen to noise makes it sometimes easier to find the root cause. Most spectrum analyzers feature only a rather crude AM demod output, or none at all.

So, for example I'd probably roll a 123MHz bandstop for work here in the lab because the local runway is almost next the house and 123.05MHz is where they call in or key the runway lights on at night. With clients at other airports it's similar, I can look up their frequencies and build a filter before heading out.

I guess that's why they still block cell bands for the US. Wish they didn't because I have to check for EMI seemlessly up to 1GHz.

> Like when I'm using my RX-320, I missed having real knobs. I'm

Same here. But when you have to schlepp it along on flights the small size and low weight is a real advantage and the laptop has to come along anyhow, usually.

Xref: g2news1.google.com rec.radio.amateur.homebrew:13658

Hello,

I'm modifying a 28-50 MHz transverter to work the new (for us) 70 MHz band, not having a spectrum analyzer I'm trying to get as close as possible with substitutions. I have a doubt about the low pass filter after the final amplifier:
on the arrl handbook I have found formulas for pi-filters:

```
----|----L------|--------
   =C/2     =C/2    R
----|-----------|---------
```

(I hope the ascii art is readable)

L=R/(pi Fc)   C=1/(pi Fc R)

Now the 50 MHz original filter is composed of three cascaded filters as the one above, the capacitor are 47pF at the two ends and 100 pF the two middle ones, which is consistent with the formula as the middle ones can be actually seen as two parallel capacitor for the cascaded pi-cells, the formula indicates an Fc of about 63 MHz with these values, which seems correct.
The inductors are 6 turns, internal diameter 6 mm, enameled 0.8 mm wire, no spaces between turns for the two "external" inductors and 7 turns same diameter for the internal one.
These inductors should have an inductance of 0.17uH the 6 turns ones and 0.21 uH the 7 turns one and the formula don't agree with these values, can anyone explain where I'm wrong?
Thanks in advance

Francesco IZ8DWF

Actually I found my mistake, the formula I was using for inductance required the external coil diameter and I was using the internal diameter, so everything is clear now.

For instance the values you suggest are just right even calculating with the formulas for a scaled cutoff frequency of about 90 MHz.

By the way, this filter is clearly for 50 ohms both input and output, one side is the antenna and the other side is the output impedance adapter filter of the final transistor.

Now the question is if I should try to use the same final (and driver) transistor of the original 50 MHz transverter (2sc2166 driver and 2sc1969 final) which are 27 MHz transistor (working fine at 50 MHz).

On the datasheets I have been able to find there's no indication of their ft.

I have a better final transistor but it would require me to move the amplifier part outside of the original box (different case).

Thanks and 73

Francesco   IZ8DWF

Greetings:

Please view these photos of a three-turn planetary drive
pot that uses a conventional "stackpot" formfactor at
http://www.cybertheque.org/homebrew/rcvr/images/antennas/pot.jpg
Resistance = 1K

It was made in 1966 by CTS; stampings: 36129 137.6637

Does anyone recognize this pot technology? Any suppliers
nowadays? I need the form factor for modifications to antenna
rotator assemblies in a space that does not permit using
larger multi-turn pots and using trimmer versions is not
sufficiently robust.

Regards,

Michael

i remember these used to have slippage problems at the ball to shaft (after
a few hundred rotations) and required feedback looped mechanical drives to
accurately position anything they were used to control.

try something new!

I am not a ham; but got a response from a G amateur who confirmed he
used plastic coated steel cored clothesline wire for his antennae in
northern Britain.
He mentioned he was located in a fairly windy area and said that even
though the plastic eventually cracked and the wire corroded it lasted
quite a few years and was strong and reasonably cheap.
For occasional 'quick and dirty' receiving I capacitively couple my
receiver to our steel cored clothesline (all of 6 feet above ground!)
by wrapping some turns of wire around it. BTW I must go and bring in
the towels drying on it!
Have also used the steel messenger wire stripped/salvaged from
scrapped cable TV drops. Cable techs sometimes just abandon it and or
will give you the old when they install a new replacement drop.
Cheers.

No: But I vaguely remember a QST article of the 1950s? about a
receiever that used many 'stagger tuned'? IF circuits to get bandwidth
suitable for amateur work? Also IIRC it was an American husband-wife
team who wrote the article?
Terry

Wow, I had seen those in the past but not for many many years.

If you are truly updating some rotators, there are some articles in
QST, CQ, 73, etc. from the past 20-30 years on doing it using
something other than 360-degree pots. Some of them use essentially
homebrew shaft encoders.

Tim.

I remember them, also, and the slippage. I used to lube them to make them work better. They didn't.

I now know they must never be lubed and must be kept really clean. They work because of the friction between the shaft, the ball and the housing. Our pick-and place machine, used to place SMT components on circuit boards, uses the same technology to convert rotary motion to very accurate linear motion. The wheels and shaft must be kept very clean, or we get positioning errors.

I have no clue about the current source of the devices, but probably have a few in the junk box!

Paul, KD7HB

I guess a look at the guts of an old piezo tweeter could give you a hand. Or maybe, an old old crystal phonographic pickup?. An ultrasonic cleaner perhaps?.

agreed, i have used pc mouse encoders with a hacked mouse circuit board for various projects.

2 axis, three butttons , plenty of easy to use software, even write your own visual basic

can even determine direction and speeds!

its all simple enough and uses standard rs232 ports.

mouse click buttons can be used to determine limit positions at extreme points

the newer mice with some 6 or 7 variables can do lotsa stuff!

```

Do you mean the rotator or the controller?

For the rotator, you can maybe use a standard pot with gearing. I made an old 3 wire rotator a 5 wire with a pot an a 4 to 3 gear. One gear was fixed to the output shaft, the other to the pot, so that one full rotation (360 degrees) of the rotator shaft turned the pot its full path, or therabouts (270 degrees). The controller just had a typical 270 degree pot and a 3/4 scale that rotated N-E-S-W-N.

Interesting. I've never seen a pot like this.

So the turns ratio is determined by the shaft diameter to ball
diameter ratio?
And the wiper arm is connected to the ball carrier?
So this assumes the metal to metal, shaft to ball won't slip, but the
ball will turn in the carrier, causing the carrier to have 1/3 the
rotation of the shaft?

Sorry, this doesn't help you at all...
Alan Nishioka

<snip>

I had considered gearing but the available space and the
necessary additional fabrication was more involved than
the solution I chose.

Here are photos of the modified rotor:

http://www.cybertheque.org/homebrew/rcvr/images/antennas/rotor/

This rotor is common to a number of makes and models; the controller
that came with it was for the Cornell-Dubilier AR22R, an interrupter
based spring and escapement controller version.

The modifications permit continuous rotation and rely on the
controller to manage limits.

Regards,

Michael

The ratio, is determined by the shaft diameter, to the internal diameter of the casing in which the balls sit.
If (for instance), you have a 3mm shaft, and 10mm balls, the casing has to have an internal diameter of 26mm, and the ratio is 26/3 = 8.66:1. The drive can be made remarkably good (the same system is used on some micro focussers for telescopes, which carry significantly more torque than needed for a pot). Units like the 'Williams optics feathertouch focusser', use exactly this drive.

Best Wishes

================

Sorry ,but I don't understand the above .
If the shaft has a diameter of 3mm and the balls a diameter of 10mm, the inner diameter of the casing should be 10 + 10 + 3 equals 23 mm

When the shaft makes 1 revolution the balls will make 3/10 revolution .
When the balls make 1 revolution the casing makes 10/23 revolution .
Hence when the shaft makes 1 revolution the casing will make
3/10 * 10/23 equals 3/23 equals 0.13 revolution , hence reduction factor is 7.7
Please correct me if I made an error.

I could be missing something, but at first glance I read the radius as the diameter of the 10mm ball (10mm) plus half the diameter of the 3mm shaft (1.5mm) and get 23mm internal diameter, ratio of 23:3 or 7.66:1.

Just in case this turns out to be a corecktion I've included speling erors to comply with tradishun.

Yes. Sorry, I just added up the internal diameter wrong....

It is fairly simple to visualise what is happening, if you realise that the balls are rolling round the internal diameter of the casing, driven by the small shaft at the centre, and for the assembly of three balls to complete one complete turn, their surfaces, must travel the internal diameter of the outer casing. Since the surfaces of the balls are driven by the internal shaft, you get the ratio from the ratio of these two diameters.

Best Wishes

I had never heard of a piezo tweeter before your post. They sound like a different type of device than what I am pursuing. I need an earpiece with very high impedance, one that can work off of the nominal potential a crystal radio circuit can produce.

But hey, thank you for the feedback, my world is ever so slightly larger than before...

Go to <http://www.allelectronics.com> and do a search on their website for "piezo".

They have a number of Piezo elements available at reasonable prices.

A colleague is looking for someone to assist him in writing some pic
code for the 16F88 chip.

This is to drive an LCD on a FM broadcast transmitter.

If you think you can help for a negotiable fee then please drop me a line:

sales (AT) transmittersrus.com

Thanks

Hi Francesco,

I guess you have things figured out pretty well now, but for future reference, I'll offer a few additional points:

-- You can get some pretty decent filter design software for free from www.aade.com. It will tell you a lot about the expected performance of the designed filter. It also has coil design help, though the dimensions are in (ugh) English units.

-- You can also get the evaluation/student/ham version of Elsie from www.tonnesoftware.com. I've been using the professional version for a while now, and I think the value/price ratio is very good. I've evaluated some much more expensive filter design programs that offer only marginally better features.

-- For coils used at HF and above, you will get better Q if you use a little space between turns. That is, if you need a coil with, say, 1mm turn pitch, it's better to use wire that's about 0.5 - 0.6mm diameter, than to use wire that's 1mm diameter. For example, according to a coil program I use and trust, your 6 turn coil should be about 186nH, with a Qu of 150 at 50MHz. That's using 21AWG (0.724mm) wire with 0.80mm turn pitch. Changing to 26AWG wire, same turn pitch, now the pitch is about 1.9 wire diameters, so there's almost as much space between turns as the wire diameter. Now the inductance is predicted to be about half a nanohenry less, but the predicted Q is 175. You might think at first that the larger wire will have lower RF resistance, but the proximity effect of closely spaced wires dominates as the turns are immediately next to each other.

-- You can wind coils with nice even spacing by winding them on the

threads of a bolt. After you unscrew the bolt, if the wire diameter
is fairly large for the particular coil diameter, the coil may well be
self-supporting enough to be useful as-is. You can further stabilize
it by putting a couple rows of appropriate glue parallel to the axis
of the coil, making it look a little like the old "Air-Dux" coils.
Use glue with reasonably low dielectric constant and low RF loss.

Hope this is helpful.

Cheers,
Tom

Quick note-had to finally give up on the single turn of antenna wire through
the tuning toroid idea due to such severe signal degredation.  Went back to
directly connecting the tank circuit to the antenna input.  Am still open to
new ideas though, and seek any further input from the group.

Thanks,

Dave

Hi Frank and all,

> I have 'heard' that in some countries (but not in the UK)
> electro-mechanical kiloWattHour meters can rotate reversed when fed

I have never seen a reversible mechanical kWh meter and also never heared of
this, except running reverse due to incorrect wiring.

In our current home (IJmuiden, NL) we have an electronic 3-phase meter with
two counters for peak and off-peak. This meter also has a T3 to measure
energy supplied back into the net, though that requires a special contract.
It's a single LCD showing the counters sequentially.
I know the previously used electro mechanical meter in this house was
switched by a 230Vac signal on an extra wire in the mains cable. I'm prety
sure there are two 1.5 or 2.5 qmm wires with the four 6 or maybe 4 qmm wires
in the cable.
There still is an old boiler relay on the meter board controlled from the
same signal.
The new electronic meter might be frequency controlled.

In the previous home we did have an electro mechanical two-tarif meter and I
think that one was switched from an electronic unit that I presume was a
frequency selective relay.

The meter back in Newbury was just the standard single phase, single counter type.

I would expect that all modern wind turbines use rectifiers direct on the generator and then have DC power fed to one or more inverters in the base of the mast.
The inverters are synchronised to the grid before switching the generator on the net.
This is as I remember from college and as I read in the technical description of the wind turbine on which PI3WAD is installed.

Jim,

I have a PK-3 Keyer I got from Jackon Harbor Press as kit to use in a 10 Meter Beacon. But I ended up using a KID Beacon ID controller for

the beacon instead. The PK-3 is a iambic keyer with 2 memories plus
callsign memory, side-tone, auto CQ, beacon, A/B modes, 5-39 WPM, low
current, Tick compatable. It uses a 12CE674 PIC keyer chip. I built
and wired the PC board but never installed the PIC chip. I paid $19.95
plus shipping for it. I've never used it and am not going to. If you
are interested in it I'll ship to you for $15.00. That's $10 for the
keyer and $5 to cover the cost of shipping USPS Priority Mail.

Jim

Found a schematic where a 50 ohm swamping resitor was used on a 4cx250. This
worked great on a pair of 6146s

<xpyttl_NOSPAM@earthling.net> wrote:

>There are dozens of kits ... the combination FCC1/FCC2 from Norcal is one, AA0ZZ's has been mentioned as another. Kanga has a board called the PIC-EL II that will accept AmQRP's DDS-60 daughtercard and in conjunction with software available from AA0ZZ's website will do the same, plus, it has the PIC programmer on board, so you can play with various versions of the software. All 3 end up costing about the same. FAR Circuits has a board for the old WB2V model which works reasonably well and ends up considerably cheaper.
>
>If you are concerned about soldering the AD985x chip, there are dozens of folks who do that for a small fee. In fact, if you graze the QRP lists you will discover that there are probably hundreds of folks who love to build kits so much that they are floating in them, and a looking satisfy their addiction by building kits for other people so their XYLs won't scream at the increasing pile of unused electronic gear.
>
>The PIC-EL path is probably the most conducive to experimentation, but the most poorly packaged if your intent is to include it in one of your projects. AA0ZZ's has I-Q outputs if you are interested in exploring SDR. The FAR Circuits board of course includes none of the parts, the Norcal kit is lacking the expensive parts (switches, connectors, etc.)

The Pic-El route is possibly the best as the DDS board is a removable item and can be built into a dedicated controller after establishing which version of the software is the best for your application.
It also enables you to 'play' with PIC controller programming, you might even write your own software for the project :-)

Hi All

Idea
IF amp. 9MHz - single ad600 working in sequential mode, AGC realized with AD8307 and opamp (http://www.mydarc.de/dc4ku/S_Meter.pdf - bild1)
control voltage for AGC realized with TL431 similar to cdg2000.

Problems
1. - find a simplest way to implement a manual IF control. ("manual" does NOT mean turning off AGC but possibility to change amplification)

How? Change a control voltage? add a manual regulated stage??? How to realize threshold?

2. How to changing a time constant of AGC

Any directions or ideas? (www?)

Hi MAc,

Can you give more examples of what you mean by "manual IF control", I
don't understand what you want to do.

Do you want to:
- Adjust overall dynamic range ?
- Adjust centre frequency ?
- Keep current dynamic range, but apply an offset ?

- etc

Do you have an English translation of your paper ? it looks most
interesting.

Regards,

Mark

Hi Mark.
I haven't English translations, only German text

> Can you give more examples of what you mean by "manual IF control", I
> don't understand what you want to do.

:-) What do I want, hmm
1. Realize and adjust threshold - You see, that it is simple detector
wirhout threshold
2. Adjust time constant of AGC
3. KNOW how to realize IF GAIN (any way) - I dont know what is the best
way - may be offset, may be additional stage, may be czanging the
dynamic range - I am just seeking informations.
What ist the way used in commertial gear? - AGC is stilll working but
amplification can be changed.

Best
MAc

PS I have also an article from FunkAmateur Januar 2005. If you want I
can send you.

Hi MAc,

Take a look at the AD8367 variable gain amplifier. Watch out for the input impedence of 200 ohms. Should be easy to match to 50 ohms using a 2:1 bifilar tranformer.

Is that the sort of device that you are looking for ?

Regards,

Mark

PS Thanks for the offer of the article, is it in English ?

> Take a look at the AD8367 variable gain amplifier.

Interesting, thanks

As i wrote i have an IF amplifier based on AD600. Two stages are working in sequential mode. It is working very good.
An AGC detector with ad8307 is also workink good - but i need change my current linear characteristic of AGC to charakteristic with threshold.
Now I can only change a slope of LINEAR characteristic - and i need to change more parameters.

> PS Thanks for the offer of the article, is it in English ?

Sorry, It is in German too, but most important informations are in application note of ad8307 page21 - very interesting 120dB AGC system.
Similar to used by w7zoi.

I have a quantity of NOS Military surplus items listed here before going to the BIG 'E' :

34 WATT, WW, 140 OHM 4" L x .75" DIA. --IN ORIGINAL BOXES. HAVE 100+

100K OHM POTS -NOT LINEAR (IE: 50% TURN DOES NOT GIVE 50% OF VALUE), USES A BAND OR WIRE WHICH IS SHORTED AS THE SHAFT IS TURNED. 3"L .250 SHAFT. HAVE 100+

SPRAGUE KOOLOHM 5W, 15K HAVE 30+

Will also have a few 1M + AC SWITCH, and an additional value coming.

1.5MF AT 250 VAC, HAVE 9

2 MF AT 600VDC, CD HAVE A VERY FEW

30 WATT, WW, 8K COMING

Can supply 1 to max number I have. Make offer- pay by MO, check, Pay Pal.

Advise of ur interest: heytubeguy@yahoo.com

I would firstly put a cap on the input to short out radio frequencies to ground.
220pf from signal in to ground works well for me.
Ground the case too if its metal.

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 17th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly, will be admitted FIRST.
Separate lines will form prior to gate opening for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered

well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

Greetings:

Homebrew online HF receiver located at approx. lat. 46.8, lon. -92.1 is now accessible at:

http://www.cybertheque.org/homebrew/rcvr

Receiver controls are realtime, not transaction based, and audio is also realtime, not delayed in an mpeg stream. You will need voip (SIP) capability to hear the audio until I am able to include a java rtp client in the web page.

If you do not already have a SIP service provider, a free account may be created at:

http://www.iptel.org/service

The web pages will add features as the project develops and the receiver controls will add capabilities beyond the basic ones currently implemented.

Currently, there is no queuing of user access so a chat session is provided on the main control page to permit waiting users to coordinate their activities. Also, only one audio connection at a time is currently implemented.

In the future multiple audio connections will be supported and a user login procedure will be used to coordinate access.

Please email me at the address noted on the web pages for questions and feedback.

Regards,

Michael

Thanks for asking; I have not had the opportunity to yet measure the receiver's performance (noise figure, IMD, sensitivity, etc.) and while the design is still evolving the current leading particulars are:

1. Dual conversion from 1Hz to 75Mhz, with frontend passband currently 140kHz to 30Mhz, traps for local FM RFI, 50 ohm nominal input impedance, selectable RF amps.

2. 1st IF 55,850 kHz, 2nd IF 455 kHz, two filters ~2 kHz for SSB and 5 kHz AM.

3. 1st LO is a programmable PLL with a wide variety of step sizes and large dynamic range; I am using 2kHz steps and a range from 55,851 kHz to 131,068 kHz and a 16-bit resolution.

4. 2nd LO varactor tuned xtal osc. at 55,395 kHz with a >2kHz dynamic range, 13-bit tuning resolution (1 Hz) using a 3-bit DAC to select one of eight 10-bit segments tuned by a PWM through a 3rd order LPF with 10Hz 3db bandwidth. The mcu handles the tuning of the LOs to permit a continuous 1Hz resolution over the receiver's range. Tempcos of components are yet to be analyzed but stability has been quite good (within 1Hz/day). Auto calibration will be implemented but for now tuning errors may be up to 30Hz and can be measured against WWV which at this time of year at this QTH is heard nearly continuously on 2.5, 5, 10 and often 15 MHz.

5. IF frequency counter, 20-bit, with selectable prescaling, used for tuning centering, ersatz synch det. on AM, etc.

6. Product det. for CW/SSB, discrim. for FM (I anticipate implementing FM as a selectable mode on 6m and above when I do the proper front end changes). The tuning scheme currently centers BFO in the 2nd IF passband for symmetrical SSB; I may add USB/LSB offsets.

7. RF section is fully enclosed in a tin faraday shield with a number of bypassing schemes; some birdies are still introduced on the digital I/O lines entering this can which I hope to squelch with properly designed LPF.

8. Digital section is also fully enclosed in a tin shield and physically separated from the RF section. I designed it around the Intel 8096 mcu; debugging and programming is facilitated by having an HMI-200 ICE. Operating software is uploaded over an RS-232 port which also serves as the control port for the receiver. The mcu has enough resources to implement features such as ALE, digital modes, spectrum surveillance, etc. but DSP features will be offloaded to dedicated processors.

9. Audio monitor output is 8 ohm with provisions for stereo and a 5000 ohm output feeds the audio stream server.

10. Receiver and antenna are viewed as an integrated system; the antenna is a modified Marconi matched with a 9:1 impedance ratio quadrifilar-wound balun, isolated primary, to a 50 ohm coax feedline. The antenna has a good ground which has a very short lead to the balun ground in the Marconi configuration. The feedline shield is not grounded but is continuous to the receiver chassis which currently is also not grounded (this is very low noise). The feedline is enclosed in plastic pipe and buried 18 inches deep in the soil from the antenna feed to the shack further attenuating noise. The system performs well in a very hostile RFI/EMI environment; our QTH is noted for some of the worst QRN anywhere and the huge antenna farm for broadcasters and public services is on a peak very nearby and causes much grief for radios with less than excellent dynamic range/IMD and selectivity.

So far no one has tuned the receiver or made an audio connection. It is remarkably easy to hear the audio using a SIP user agent (any voip phone that permits dialing SIP URIs such as 'SIP:9202@cybertheque.org'. I had suggested 'firefly' which is what I use, but it only handles numeric URIs (so it must be registered on the callee's SIP proxy server). Instead I recommend a version of X-Lite, which I made available at:

    ftp://ftp.cybertheque.org/pub/xten

This is a Windows SIP softphone which permits dialing our SIP uri from another network, .e.g. iptel.org. Please set up a free account at iptel.org, download and install X-lite, configure it for the iptel.org account, and dial the above URI to hear the audio. Access the web page to control the receiver. At some point I hope to dispense with the need for SIP dialing by including an RTP audio player applet in the web page (such a beast isn't currently available, only JMF heavyweight code which is unsuitable).

Regards,

Michael

I forgot to mention the AGC; various time constants are
selectable and signal strength is read by the ADC in the mcu
for S-meter and link-quality data.

I would like to clarify how my online interface is
different from the 'web controlled receiver' RCSweb
(N30EA) interface commonly used for Internet access,
which may make it worthwhile to take the time to

configure a SIP client to hear the audio. The RCSweb interface posts commands from web forms to the radio to make settings; the user fills out a form and waits for the results to appear at the receiver, often the user must 'reload' the web page to see if his settings were honored. Most often the audio is streamed using mp3 encoding and suffers from buffering delays of many (up to 30) seconds as well as network QoS latencies. There is no provision for hands-on tuning as you would do if you were physically at the receiver.

My interface provides an interactive hands-on receiver tuning and controlling session; there are no forms to fill out, no page refreshes required and no waiting or latencies for settings to take effect. The audio is streamed in real time so that you immediately hear the results of your control of the receiver.

My thanks to those who will try this and provide some feedback of their experiences.

Regards,

Michael

Very well thought out, and a fine piece of homebrewing.

The suggestion about writing a QEX article is right on. I'd sure like to
learn more.

Keep us informed

Joe

Hello,
I am designing a radio receiver and I need a narrow filter in the FI
stage,
at 10.7 MHz, in order to filter a single carrier.
Anybody could tell me where to get information about designing ladder
filters?
Thanks :)

It depends on what you need. Don't forget that the first single signal selectivity came to receivers in the thirties, via a single crystal filter. I'm suddenly blank about the name, but it was a balanced transformer feeding a crystal on one side and a trimmer capacitor on the other. You'd trim out the crystal holder's capacitance with the trimmer. Not perfect skirt, but really great selectivity. Later, variants would appear where load resistors were added to broaden the selectivity for voice.

Much later, you'd see them cascaded, to improve the skirt.

Their big benefit is that you don't have to have more than one crystal frequency, up till ladder filters started making a mark some years back, crystal filters all tended to use crystals separated in frequency by about the required bandwidth. So you'd see these cascaded filters as add-ons, and in the age of solid state, the balanced transformer was replaced with a transistor, with the collector and emitter acting as the two sides of the output winding to drive the crystal and variable capacitor.

For sloppy selectivity, there has been lots about just putting a crystal or ceramic resonator in the cathode of a tube or emitter of a transistor. I'm sure for many applications, that would work fine, and doesn't requre any fussing.

IIRC, that's what the BC-348 employed. My BC-348 has several
inspection stampings dating to circa 1938-39.

The latest ARRL handbook comes to mind. Have you web searched?

It is often profitable to choose a frequency at which you can get lots
of inexpensive crystals -- it's often cheaper to buy and sort through a
bag of 50 cheap crystals than it is to order four custom made ones,
unless you're counting the value of your time.

And if you _are_ counting the value of your time, you'll just want to
buy a crystal filter, or a whole dang radio!

Have a quantity of Radio Communications Service Manuals, both Commercial &
Amateur that I have rescued from the Dumpster.  Most ot them are in Like New
Condition.

Please check my site:   www.rodemi.com    for what is available. I am
updating the site as time allows.
I recently retired from the Commercial 2-way radio business

$60.00 Each   Midland 70-340 VHF APRS/Packet Radio   [Plus Shipping]

I have a quantity of Commercial Midland 70-340 VHF Mobile Radios 25-30 Watts O/P comes with a Regular Power Connector, Mobile Mounting Bracket and a Midland 70-2301 Palm Mic (which you don't need if you are only using APRS or packet). These radios will work excellent as an APRS Mobile OR Base Radio Station. Using this radio is much cheaper to use for dedicated APRS use rather than spending Large Dollars for a VHF Amateur XCVR and dedicate it to One Channel APRS use. The radio is Programmed and Tested Operational on 144.390 Mhz.

IF you wish the Power Cable pre-wired c/w a DB-9 Male   [ADD $20] > ready to plug into a Tiny Tracker APRS Unit or any External Interface < Schematic Drawing of the Interface Cable is supplied

Midland 70-340 VHF Service Manual available on CD with a Radio [ADD $10] Sold Separately [ADD $15] includes Mailing

These radios are capable of 36 Channels and comes with a CTCSS Board, should you need it.   I can program them for other 2 Meter Frequencies for a charge.   Please ask should you have any questions.

Thanks for looking....Norm VE3CZI

Anyone know if this is on the Web somewhere? A Google search returns a pile of Asian-language sites, one of which might have the information if only I were literate in Chinese/Japanese/Korean...

It's the logic chip in a cheap mini FM transmitter, sold for use with MP3 players. I'm trying to change the frequency selections, as none of the factory choices (88.1/88.3/88.5/88.7MHz) are usable here.

I did find a schematic for the transmitter as a whole on the FCC website but changing the logic level of a pin that *seemed* appropriate caused the unit to stop working altogether. (or shifted the frequency out of the FM BCB...)

Hi Doug,

http://electronics-diy.com/BH1417_PLL_Stereo_FM_Transmitter.php

http://www.datasheetarchive.com/datasheet.php?article=984027

Could you email me what you found on the FCC site please.

Thanks,

Mark

My notes, based on a ripping into a unit I got from Wal-Mart a while back, disagree with your factory choices. According to my notes, pin 18 to Vcc selects a band which has choices of
88.7/88.9/89.1/89.3/89.5/89.7/89.9.
And pin 18 to ground selects a band which has choices of
107.7/107.9/108.1/108.3/108.5/108.7/108.9. Maybe due to this disagreement you've got some customized or different variant version of the chip. I think my chip was a BH1417-something or other (Rohm?).
Is HY Hyundai or something else?

The unit I was playing with had a varicap and a small coil for tuning the VCO of the synth. I had to remove a few tunes from the coil to get it onto the 107-108Mc band as opposed to the factory 88.7-89.9Mc band.
It didn't stop oscillating when the coil was out of range, but it didn't lock either.

Tim.

That's where I got my unit, but it would appear BH1417 and HY1417 are two different chips. I can't change the logic level on pin 18, because the HY1417 has only 16 pins<grin>!

My unit has another chip, six pins, that appears (both from physical inspection and the schematic) to be the actual PLL. Performs the function of the MPSA13 and pins 7-9 on the BH1417. HY is not Hyundai. I can't remember what it is & left the printouts (and the FCC ID# for the unit...) at work...

As I mentioned in the other reply, HY1417LP and BH1417 are two different devices - HY1417LP has only 16 pins but is used with a separate 6-pin chip which appears to be the VCO.

I of course managed to leave the battery cover (with the FCC ID#) at work last night so won't be able to look up the exact link until much later. I've not been having any luck looking up the FCC ID#s on various other pieces of electronics in the house. (type in the ID# exactly as it appears on the sticker - and the FCC says it doesn't exist...) But it worked with this device. On this URL:

https://gullfoss2.fcc.gov/oetcf/eas/reports/GenericSearch.cfm

you put in the ID code, look under Attachments, there may be one for a schematic. The manufacturers can mark it as confidential but in this case they didn't.

Certainly it was described first by Lamb, or he actualy came up with
it, in that famous 1930's article about improving receivers.  Basically a
phasing crystal filter, which I suddenly was blank about when I posted.
I'm not sure I've ever seen it called a "Lamb filter", though perhaps
if you go far enough back in the books, it was once called that.

Actually, it wasn't. Don't recognize the famous 1930's article you refer to, but Lamb came up with the Lamb noise blanker. The principle of operation being to turn off the IF strip while the noise pulse was present, the "hole" being less noticeable and annoying than a huge noise spike. Walter Cady came up with the single crystal filter in 1922. Incorporated in most superhets during the years 1925 until the ladder, half lattice and full lattice filters came along in the 60's.

The QST article is pretty famous, and at the very least is credited
with bringing single signal selectivity to amateur radio (if not the world).
I can't find a paper reference, but it might be an article titled
something like "What's Wrong with our Present Receivers" from 1932 (though
I thought the specific article had come later), and it may be
referenced in Byron Goodman's January 1957 article of the same name.

Everyone credits the article with bringing single selectivity to
amateur radio, and I can immediately find some web references that claim
(and I've read this somewhere in the paper literature) that Millen used
many of the ideas in the article for the HRO receiver. The noise blanker
may have been described in the same article.

And of course, it was lattice and half lattice filters that came along
in the fifties that allowed many to build SSB transmitters, if they
couldn't afford mechanical filters and didn't want to use phasing. I
never saw a reference to ladder filters (except for some oddball bit
in the SSB column in the fifties that had two serial crystals and one
going to ground where they joined) until the seventies, and it was more
like a decade later before they became popular in hobby circles.

Jeepers. This thread is getting as long as some of Cecils threads. I hope it isn't as dumbfounding.

James Lamb, 3CEI, 1CEI and W1CEI, was tech editor for QST in the 30's. As such, unlike todays offerings, he ALWAYS had at least one technical article in each issue starting as early as March 1928. One of those articles was in June 1932 and was titled "What's wrong with our CW receivers?" That article had to do with audio selectivity and no crystal filter was mentioned. In August 1932, he published another article, "Short Wave selectivity to match present conditions". This was amateur radios first published introduction to the single signal crystal filter

In this latter article, Lamb acknowledges the pioneering work of Cady in a footnote, who published his discovery and design of the single signal crystal filter in the Proceedings of the IRE over 10 years earlier in April 1922. Lamb only repeated Cadys work in QST. He may have brought it to the amateur fraternity, but the world knew of it from the Proc of the IRE some 10 years earlier.

Lamb WAS responsible for the invention of the "Lamb noise silencer" which bears his name some years later.

There is a guy in Dover Pa. named Charles Byers and he custom
builds chassis any size you want. He is a ham although I forget
his callsign. I do know he lives on Harmony Grove Road however.
Look him up.

Hello,

I am working on micropower 433,92MHz battery powered receiver and have a problem with LNA. I have tried a few configurations (including cascode) but I cannot lower current consumption below 400 uA. It is too much for me. I don't need high gain because this LNA is to be a buffer only but device price should be as low as possible. Have you any idea how to lower the current? I don't need exact project but some advice.

Greetings
Leopard

Hi Leopard,

What is your DC power budget, signal gain, NF etc ?

- Volts, DC
- Current, DC
- Gain, dB
- Noise Figure, dB

Might it be acceptable to switch on the LNA occasionally, but have it sleep for 90% of the time ?

-Mark

Please note that if you are running the LNA or mixer at very low
current, the strong signal handling will be very poor from signals at
the frequency or nearby frequencies. If you are going to run the LNA
or mixer at very low currents, I would strongly suggest that you put a
very narrow filter centered at 432,920 MHz in front of the LNA,
unfortunately the filter losses will degrade your system noise figure.

Can your design live with fewer MIPS and a lower sample
rate (downconvert the IF)? I'm working on a design
using a old DSP sound card which will talk to my mcu in
the radio; the card has a TSM320 DSP, a great (free)
toolchain, lots of sample code, and no need to fab a
pcb. Of course its resources are an order of magnitude
less than you've specified but it will still do filtering
and demodulation.

If this approach is of any use, I'll send you the toolchain
and docs ;)

Regards,

Michael

1. I generally do this by prototyping the algorithms using Scilab, or designing them on paper, then figuring out the number of operations (for MIPS) and data storage requirements. You'll probably find that the FM demodulation takes the most processor time, unless you're decoding multiple SSB channels for some odd reason.

2. I make a conscious effort to not fall in love with any particular processor. Look at a few different choices in your target word size and data type, and try to get a feel for how much time it'll take to run your algorithms.

1 & 2. _Don't_ forget the 'regular processor' stuff when you're sizing memory and processor bandwidth! Wouldn't you feel silly if you had 20 times the RAM you needed for your DSP, but didn't have the buffer space necessary for your TCP/IP stack, or if your algorithm took up 500 words of memory but you ran out of space for menu lines in ROM? Generally with these mixed-target DSP projects you can expect 1% of the code to take 95% of the consumed processing power; you need to make sure you have the code space for the other stuff.

Hi Mark

> What is your DC power budget, signal gain, NF etc ?

> - Volts, DC

3V

> - Current, DC

as low as possible, battery 300mAh should work minimum 1 year. Maximum average current should be less 30uA. I wonder if this is feasible at all?

> - Gain, dB

2-3dB quite enough. My receiver is superregenerrative device and it's sensivity is good but I have to add buffer to fulfill European RTTE norms.

> - Noise Figure, dB

This is a short range communication max 100m, transmitter has about 1mW power so the NF is less important than current consumption.

> Might it be acceptable to switch on the LNA occasionally, but have it
> sleep for 90% of the time ?

I thought about that. I have found such a project on EDN site. The current consuption of the whole receiver is about 200uA but it is still to much.

I am way behind you guys on the DSP-SDR subject but I appreciate every scrap of information you share.

I am currently trying to puzzle out the strategy used in acquiring data from a sound card.

I have successfully built the Softrock Lite 40 meter receiver and am ever so slowly working on a Softrock RXTX Ver 6.2 40 M transceiver.

> the ADSP-BF532 which is a fixed point DSP rated
> at 400 MIPS / 800 MMACS

800 MMACS is a pure marketing. The 400 MIPS is closer to the reality.

  and is available in a LQFP

>   to know.

* It depends
* The barebone DSP functionality will take about 20...30 kbytes of the program memory and several kbytes of the data memory.
* For the single channel processing, the workload should not exceed about 100 MIPS.

> 2) Anyone have a specific DSP they favored for
>   this type of application?

It doesn't matter. Whatever DSP you wil take, you will be screwed many times.

> Keep in mind I
>   need the DSP to be in a package I can handle

The general purpose stuff can easily boost the program size over the DSP internal memories.

> I'm not looking to use a FPGA at this time.

Why don't you start learning DSP with something simple like FIR or IIR filter?

Probably because he finds a "Software Defined Radio" to be fascinating. I know that's my motivation for applying fft's to speech and GPS errors. I'd lay odds that the majority of scientific/technical progress is due to amateurs. { please check your etymology before opening fire ;>

Think about bio's of ancient Greek philosophers<etymology;>, membership of Royal Society(astronomers particularly came to mind), Einstein, Goddard, Avins, Lyons, Allnor ... thru eons of grad students and even some professors with Phd's.

I mean this toy will work however the performance of the classic analog
receiver of the communication class is much better.

I'm willing to accept some tradeoffs for the sake
of simplifying the design (i.e. the AD9874 integrates
an ADC and digital filter which is convenient though
less flexible then a ADC coupled with a FPGA).

> however the performance of the classic analog
> receiver of the communication class is much better.

That seems to imply some type of fundamental limitation
exists with using the AD9874. Care to be more specific?
For example the AD9874 spec claim 95 dB dynamic range,
there are certainly radios which claim a higher dynamic
range. However I'm imagining that a 95 dB dynamic range
should work for a lot of signals.

I am not familiar with that specific component, but does it really contain a decent S&H circuit for decimation ?

Even with a proper S&H (ten nanosecond sampling and several microsecond hold times) for decimation, the 280 Ksamples/s sounds a bit low for FM broadcast detection. The higher order (Bessel function) sidebands are still quite strong with the modulation indexes used, so truncating the bandwidth to the 100-140 kHz range might not be a good idea.

If you after all want to include broadcast FM reception, I would suggest that you do the reception in analog way and only go to digital after the ratio detector, when 150 kHz sampling rate might be sufficient for stereo and RDS separation.

For the other modulation modes, I would suggest using a high 1st IF (40-80 MHz) with a proper roofing filter combined with a few IF stages and AGC. This signal might then be decimated directly (or after converting to 455 kHz for steeper filters) and processed at sampling rates well below 100 Ksamples/s.

With the roofing filter and the AGC in the first IF, the ADC should be able to handle large signal variations, as long as the offending signal is not within the roofing filter bandwidth.

The IF passband of an FM receiver needs to be at least 200 KHz for good quality and -- counterintuitive to me -- I'm told that the capture ratio improves as the bandwidth increases. Back in the 50s, one premium receiver -- the first I knew of to use semiconductor diodes in the detector -- had a half-MHz IF.

The IF is 1.7 MHz which is sampled using a 13.6 MHz clock by the

AD9874
and decimated by a factor of 48 to produce the 280 Ksamples/s output.

Looking at:

  http://en.wikipedia.org/wiki/Fm_broadcasting

I see that FM audio goes from 0 to 53 KHz and RDS is at 57 KHz.
The AD9874 decimation filter should prevent any signal from aliasing
into the bandwidth of interest and the resulting sample rate is
above Nyquist.

I'm missing something ... assuming no aliasing problems why is
a higher sampling rate necessary for recovering the audio and RDS?

Assuming cochannel signals with small power difference, as the BW
increases the weaker
one will hit threshold (knee in the SNRout vs SNRin curve) first. Does
that explain it?

You're looking at the audio baseband bandwidth, i.e., the signal after
being FM demodulated. From your description the signal you're getting
has not yet been FM-demodulated. Thus you need to account for the +/-
75 kHz peak deviation of the FM signal, at a minimum. If you can
swallow up the whole 200 kHz, you gain slightly better performance due
to the admission of more the bessel function sidebands, as others have
noted.

I think that there is more to this story...

In his book 'Piezoelectricity' (originally published by McGraw-Hill in 1946; 2nd revised ed. Dover, 1964) Walter Cady indicated that he first proposed the idea of using a crystal in a filter in 1921. He referred to his Proc. IRE article, and his patent US1450246, filed Jan 28 1920, granted April 23 1923. As far as I can see, the configurations proposed by Cady do not include the center tapped transformer circuit used by Lamb.

Cady went on (2nd ed, p 668): "Filters employing crystals were first described by L. Espenchied". There is a reference to patent US1795204, inventor Lloyd Espenschied of A.T.&T., granted Mar 3, 1931, filed Jan 3, 1927. This showed the use of crystals in a ladder structure.

Other work was also taking place at the same time. Robert Kinsman, in his paper:
'A History of Crystal Filters, 1988 IEEE Frequency Control Symposium,
pp 563-570,
provides some pointers. He refers to Cady's paper and Espenchied's patent, and also a patent US2005083, inventor Clarence Hansell of RCA, granted June 18, 1935, filed July 7, 1927. This shows the single crystal filter in the center-tapped transformer configuration with the capacitor to balance out the crystal shunt capacitance.

Kinsman does not mention a further patent: US1994658, inventor Warren Marrison of Bell Labs, granted Mar 19 1935, filed June 7 1927. This too shows the a single crystal filter with a center-tapped transformer configuration.

To me, the fact that it took nearly 8 years for these patents to be granted suggests that there were some major issues to be resolved.

There were also developments in the UK as described in the ''Amateur Radio Handbook', 2nd ed., RSGB, 1940, pp 70- . I think that this chapter was probably written by Ernest Gardiner, G6GR, who did much to bring the use of crystal filters to the attention of UK amateurs in the 1930's. According to the book, Dr. James Robinson, while looking for a sharply peaked device to test his Stenode theory of reception, intoduced the quartz crystal resonator into radio circuits. The book goes on to say that Robinson publicised his work in the USA during a lecture tour in 1930, and its potential use in amateur radio was first recognised by American engineers and amateurs. The book then goes on: "The excellent work of James Lamb in developing the practical applications of the circuit is well known...". The folk lore in the UK is that Robinson introduced the center-tapped transformer circuit to Lamb.

Robinson was granted at least four US patents for his work, ie US1821032, US1821033, US1898895 and US1908558. All four patents were filed between 1929 and 1930, and all four show some form of a center-tapped transformer crystal filter circuit. US1898895 is entirely concerned with a specific embodiment. It was filed on June 9 1930, but not granted until Feb 21 1933.

Two other points are worth noting:

1 Cady's book contains many references on the use of crystal filters in receiving sets. There are five to acticles in by Lamb in QST, in Aug 1932, Nov 1933, May 1935, Apr 1937 and June 1937. There is reference to an article by Robinson on Stenode reception in Radio News in 1931, pp590ff.

2. The filters invented by Espenschied were of too low a bandwidth for voice use at a carrier frerquency of 60kHz. Warren Mason found a solution in 1929 using a full lattice filter. To quote Kinsman: "Mason expanded on this work in a landmark paper published in 1934." and "... which was the basis for all crystal filter designs generated in the next 20 years." The paper, 'Electric Wave Filters Employing Quartz Crystals as Elements', was published in the Bell System Technical Journal, Vol 13, July 1934.

Thank you for the expansion. I have Kinsman, his work on monolithics alone
are worth the price of the book.

Regards
W4ZCB

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke #64
June 24, 2007
Feynman uses ham radio.
Mr. Wizard: WANTED!

P/S project completed.
More Wabi Sabi.
Field Day memories.
DX listeners.
Studying Italian on Echolink.
Getting ready to go.
MAILBAG: K2CK, NN4CW, MM station...

Tired of listening to ZZ Top or NPR on your I-Pod?   Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack? Tune in to SolderSmoke!

RSS FEED: You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.soldersmoke.com

All the programs are available here.

I hope you enjoy the program. Please send us feedback.

I've got a few of them. First of all, I've got:

450kHz CF @6kHz bandwidth   Z=20k
These units were used in the Collins 674/U, and later versions of the 651S-1 after the 2nd I.F. was switched.
75 dollars each, plus shipping........new old stock

455kHz USB/LSB pair.
I believe that this is the filter set for the Racal 6790 series
100 dollars for the pair, plus shipping

455kHz CF @ 6kHz bandwidth Z= 50 Ohms
These were special units for Collins Radio equipment. Good for that single conversion receiver project
75 dollars each, plus shipping

Pete

Using C++, it's not that hard. This page of my website,
http://sdeyoreo.tripod.com/id5.html gives the steps and code to
capture sound and fill an array with the samples from the soundcard.
Fell free to ask me more if you want.

Can you use one of the blackfin stamp boards ?
http://blackfin.uclinux.org/gf/project/stamp

Digikey sells the BF537 stamp board for US$226
http://www.digikey.com/scripts/DkSearch/dksus.dll?Detail?
Ref=141450&Row=440505&Site=US

http://www.analog.com/en/prod/0,2877,BF537%252DSTAMP,00.html

Could always try and make a network interface for controlling the radio.

I'm just starting to look at what I need for getting a similar set up but A.M
and ssb only for students to use in a lab to introduce them to the bascs of sdr.

The lecturers want the students to program different modules ,
different types of modulation , encoding and decoding, set different
sampling rates etc They want the students to be able use both c and matlab.

Looks like we'll be using a c6713 dsk as the base
(thanks to TI providing free software)
I just get to assemble/build/integrate what gets specified.

Someone in the faculty has a couple of lyrtech signalwave boards
which they aren't using(been sitting in their filling cabinet for a few
years), have to see if we can prise them off them.
Then see what it costs to get support (need the up to date software).
